With the loss of the Atari and Amiga, people at home now have to fork out at least 1200 quid for a machine capable of giving the same gaming experiance as an ST or Amiga (how many PC games use more than 320*190 resolution ?). The Germans are probably onto a good thing buying up rights to Atari and Amiga, as many coders/hackers in the Northern European Countries can and will use this kit, and for a first computer they are ideal. If they can develop a PowerPC based box its even better.

Also with 68k based kit if you can program it in asm/C then jobs in the embedded market are also pretty relevent.

Anyway I say good luck to em and if a PowerPC machine comes out then put me down for one.

Bye,

Richard.

No I don't. I saw LAZERZOOM in an advert (amongst other things) in the german ST COMPUTER
magazine as being one of a number of commercial games sold by an a
german ST/Falcon software-dealer.

Yes, the NOS written by KA9Q, but I think ftp isn't very useful w/o any
hard drive. :-)

TM>I am also interested in any info on SLIP or PPP for the atari's.

I think MiNT/MiNT-Net is the best choice, but you'll need 4MB RAM and
a hard drive.

The sofware to decompress is gzip to untar you will need sttar , both are on HENSA. There is no reliable (across all methods of transfer) way of decompressing before you transfer; and it is either slower or more expensive to transfer the decompressed files anyway.

Have fun

Agreed Hendrick. I purchased my 386 4 years ago. three years ago I was told it
was "obsolete". Just this year I purchased OS/2 - the FIRST 32 bit
program/operating system generally available for my 32-bit "obsolete" 386.
something like five years after the introduction of the first 32-bit PC (the
80386) we are finally starting to see some 32-bit software, so for 5 years
anyway no one was using that advanced aspect of the 32-bit chips
>You need to
learn alot about the PC market, cause you have no idea what >you're talking
about. Windows and OS/2 are shit (well, OS/2 seems to do>better now). Windows
and OS/2 on anything below an 486 DX2xx is a very BAD>idea if you need to do
some serious work. You just start counting how many>Windows users who is out
there, and you'll have a fine picture of how many>people are using 486 and
better, (or will in the future). And my guess is>ALL OS/2 users are using
minimum a 486 DX2xx.
You guessed incorrectly. I am running os/2 Warp on a 386DX
33MHz. It runs satisfactorily but then I have(and most people I would think)
little use for multitasking (as opposed to task switching). I do serious work
on it also, graphics (corelDRAW - which by the way I DO NOT reccomend)
All I need is more memory, lots more! which is standard PC thing, and the most
important reason why PC's are so dominant. It's not because of the hardware or
software(YECHH!) but because lots of dealers making lots of money selling
upgrades and peripherals for basic stuff. Atari dealers can't make a lot of
money selling video or sound cards. :^)

It was none other than Kim Andersen who did write on 18 Apr 95 that ....
>> The PC is also an outdated machine and the OS (Windows) has more bugs
>> than TOS.
KA> Windows yes, but who talked about using Windows.. Have you ever heard
KA> about OS/2. And if everything should go wrong, there's always DOS,

os/2 is almost a bad ..but also as dead in the water as TOS as far as user base is concerned ..despite a MASSIVE ad campaign and at least a 6 month lead over the Microsoft offering it is a complete non event !!

KA> which i belive is very bad, but still an alternative.

DOS is the reason that Windows is so bad !!! Windows runs on top of DOS lest yea forget !! WIndows is nothing more than an alternative desktop like Say Gemini is to TOS ...still subject to the same limits as DOS hence the Fact that there is only 64K limit to the GDI which anyone who has had more than a passing flirtation with MSW completely cripples the whole thing and the horrific leakage with even Microsofts own programs that exists with this resource regularly brings the system crashing around your precious data.

KA> What alternatives do we have on our Atari ?

TOS,MINTOS,LINUX,0S9,OMEN,MAGIC (okay not strictly an alternative but as much as Windows is to DOS),MROS,That cartridge port multitasking system (Can't remember its name now), bound to be loads more I haven't come across.

to me....

|> Geneva is an AES replacement, it will be a better alternative than
|> Multitos (speedwise)...

That depends which version of the MultiTOS AES we are talking about.
AES4.1 is very stable, and has a nice turn of speed, but has never been
released by atari (if you can get it, it's good). This is not the so called
TOS4.92a that has been kicking about, it's a more recent version as a
GEM.SYS. Still doesn't have the same level of functionality as Geneva though,
nor the raw speed of MagiC......

In fact your MiNT (MH-MiNT) is HSMODEM aware, it checks for the RSVF cookie, and passes all ioctl()'s to HSMODEM if applicable.

> > Shouldn't the HSMODEM patches be included in MiNT, together

I dislike the idea of including HSMODEM in MiNT itself. MiNT supports eXternal Device Drivers, there should (and will) be a proper device driver for the serial ports. Don't forget that the majority of MiNT (c.q. MH-MiNT) users is not capable of (or does not have the tools and resources) building their own kernel. It would be unfair to include all drivers in the kernel, and leave them with a 2 MB large mint.prg.

Actually I would suggest to bring down the MiNT-internal support for serial ports back to the bare minimum.

Your tools might be out of sync with your shared libraries. You're
probably using a new libc and some very old tools, recompile them
(or, better: 'cd /usr/src; make world'), and the problem should vanish.

> This may be a FAQ, but can I use a VGA or SVGA with my 1040STfm?

For all three resolutions? That'll be tough.

ST-high should be possible, but newer monitors won't sync the colour ones.

Here's a list (partly German, but the figures speak for themselves, don't
they):

------------------------------cuthereplease-----------------------------

Datei: MONITOR.TXT ï¿½ Michael Ruge Rï¿½sselsheim, den 11.11.1993

Email: Michael_Ruge@WI2.MAUS.DE)

Einige MultiScan-Monitore haben einen H.- und V.-Frequenz-Arbeitsbereich,
der auï¿½erhalb der H.- und V.-Frequenz liegt, die der ST/STE durch die Hard-
ware vorgibt. Diese Monitore kï¿½nnen die gewï¿½nschten Auflï¿½sungen nicht wie-
dergeben und kï¿½nnen ggf. Schaden nehmen.

Um einen MultiScan-Monitor am ST/STE (in allen Auflï¿½sungen) zu betreiben,
muï¿½ der Monitor die Horizontal-Frequenzen aller gewï¿½nschten Auflï¿½sungen
darstellen kï¿½nnen.

Diese sind beim ST/STE in:
Farbe - 15,625 KHz
S/W (SM124) - 35,700 KHz

Diese sind beim TT030 in:
Farbe (VGA) - 31,500 KHz
Monochrom - 72.000 KHz (NUR TTM194/TTM195/Protar 19Zoll Monitor mit
ECL-Eingang)

Diese sind beim Falcon030 in:
Farbe (RGB/TV) - 15,625 KHz
Farbe (VGA) - 31,470 KHz (~31,500KHz)
ST-Hoch (VGA) - 31,470 KHz (~31,500KHz) mit 60Hz Bildwiederholfrequenz
SM124 (SM124) - 35,700 KHz mit gewohnten 71HZ Bildwiederholfrequenz

Er sollte also einen H.-Frequenzbereich von 15,625 - 35,7 kHz haben, wobei
das Frequenzband auch grï¿½ï¿½er sein darf, also z.B. 15,5 - 38,5 kHz.

Ferner muï¿½ der Monitor auch die Vertikal-Frequenzen der gewï¿½nschten Auflï¿½-
sungen darstellen kï¿½nnen, da er sonst nicht synchronisiert wird.

Diese sind beim ST/STE in:
Farbe - 50-60 Hz
S/W (SM124) - 72 Hz

Diese sind beim TT030 in:
Farbe (VGA) - 60 Hz
Monochrom - 72 Hz (NUR TTM194/TTM195/Protar 19Zoll Monitor mit ECL)

Diese sind beim Falcon030 in:
Farbe (RGB/TV) - 50 Hz Interlaced oder auch nicht
Farbe (VGA) - 61 Hz
ST-Hoch (VGA) - 61 Hz
SM124 (SM124) - 71 Hz

Er sollte einen V.-Frequenzbereich von 50 - 72 Hz haben, wobei ebenfalls
das Frequenzband wieder grï¿½ï¿½er sein darf, aber - wie bei der H.-Frequenz
- die beiden Frequenzen beinhalten muï¿½.

Reine VGA-Monitore sind zum Betrieb am ST/STE vï¿½llig ungeeignet!
(Ich kann Dir genug Monitore zeigen, die SThoch eben nicht machen, weil es
reine VGA-Monis sind. Also ist ein Blick in die Doku dringend angeraten, ob
der Typ 38KHz horizontal macht, denn auch 35.5KHz-Bï¿½chsen liefern z.T. sau-
mï¿½ï¿½ige oder gar keine Bilder, und die reinen 31.5KHz liefern ï¿½berhaupt kein
brauchbares Bild.

------------------------------cuthereplease------------------------------

>If so, what additional hardware/software would I need? Unfortunately, I

A cable-adaptor.

Hmmmm... good analogy. But to answer your question, "Yes!" I think they should be happy. If they can do so with their superior, yet unstandard, technology, then fantastic. If not, they should dump it and follow the world leading VHS format. Sitting around grousing about how Sony Corp screwed up by not marketing Beta successfully isn't going to change the world situation and it's not likely to make them happier, either.

That last part is the most important part of your statement, IMHO. You have to decide for yourself if your 'cause' (whatever that may be) is -worth- it and if you have the resources to make the changes you desire.

I don't think Atari computers will ever achieve the status they once had or the world dominating position I always hoped they would achieve.

But... that will NOT keep me from being happy (and enjoying my Atari). :)

GVDK> just for the fact that they create processors which produce so
GVDK> much heat that you have to cool them down with fans, talking about
GVDK> waste of energy/power..)

Yup - I tried the 'biro pen top test' on my DX266, and guess what?

It melted - or would have if I left it another 3 seconds. Soggy plastic is enough to convince me thanks very much, although the blister backed it up quite well too.

The engineers at Motorola must be really upset with whats going on out there just now - especially as all their designs are based around highly efficient architectures, as opposed to the silicon lightbulbs we end up having to put up with...

:)

That's good to know. Didn't think it could access TOS dirs

: I'm a little bit further on - to the extent I have crated a partition laid
: out like a real Unix system and loaded all the Linux files onto it.

: Now the problem *I'm* having is that many commands give me:

: Unknown error -2

: and that mount gives:

: Unknown error -16
: or
: Unknown error -19

: unless I force Linux to mount the filesystems via the fstab file.

: The bottom line seems to be many commands (ie cp, touch, me etc) won't
: actually create new files. I have to use tricks like:

: cat > filename

: to create a file so that the commands can actually work with it. Its not
: file permisions as 'cat' works - as does GNU C and Elvis (vi).

: I'm using a v9PL5 kernel and the root and usr.bin archives from the TSX-11
: directory tree on the InfoMagic March CD no. 3.

: It all works fine with the RAM disk.

: Thanks

: :-)

: Roland.

: @CiX

Well, I got "mount" to work & "cp"ed all the files over, except for /dev
That just won't copy. I noticed the MAKEDEV file in there but it can't find
some external prgs (pids?) it needs to work.

Anyway when I try to boot into the hard drive it seens to lock up! No error
message at all. Gets to VFS: something (minix) then just sits there &
blinks the drive light all day. No fun! :-(

Hope you get past those errors!

1942. PAK 030/Networking Help needed!!

Newsgroup: comp.sys.atari.st
Date: 1995-05-01 00:00:00 UTC
From: acurtis@theshack.demon.co.uk
Message-ID: <acurtis-0105950256410001@theshack.demon.co.uk>
Source record: 166471

Hi There!

I am in need of help. It's as simple as that. Here's the problem:

I want to run a cartridge port network (Lantech101) using a PAK68030 fitted to an Atari STe 4Mb. The software I use at present is PowerNET. This is basically PowerDOS with a NETWork driver bolted on. This software completely fails to drive the network with the PAK system switched on. The driver loads but the network does not become active. Does anyone know of a fix for this? I believe the PAK board uses TOS 3.06, is this the problem? Does anyone out there know how to make the PAK run with TOS 2.06? I have heard that this may be possible. I am looking for compatibility, folks. If I can't get the network up and running by fair means or foul then the PAK is of no use to me. I have two Networked BBS's to keep running and I would like to use the extra speed advantage that the PAK provides.

I have heard of a program called Universal Network which is an alternative way of using this cartridge port networking hardware. If anyone has a second hand copy of the Universal Network Software that I could beg, steal, borrow or even buy I would be very anxious to hear from you.

Finally - and as a last resort - does anyone have an Adspeed ST 16Mhz upgrade? I already run one and it supports PowernET just fine as well as enabling use of high speed serial port mods as well. At 8Mhz with PowerNET loaded I cannot use a 28800 modem effectively, the processor is too tied up.

There must be someone out the who can help me in one way or another. Please email me as soon as you can. I can be reached at the following addresses:

<andyc@adlib.netkonect.co.uk> <acurtis@theshack.demon.co.uk>
<Andy.Curtis@adlib.centron.com>

Thank you in anticipation!

Cheeers,
Andy.

: Sit back, relax and just enjoy the hardware and software that you have now.
: If you later decide to change systems, for whatever reason, that's OK
: too. Life goes on as does technology. These are computers, not a religion.

Well said. It would be easy, if the real world just let people do what they want to - e.g. use computers they want to use.. But, unfortunately, the commercial world doesn't care much about minorities. Some people lose what they think is important for them - just because they don't appreciate the "right" things. Sometimes even the best things disappear, because some marketer does his/hers job better than the others.

Think about BETA or V2000 video's owners... Should they be happy? We have two choices: to let the world rule us, or to let us to rule the world. As long as the great majority just swallows what the commercial world throws them, we're not the rulers. We're just servants.

If we _really_ think rationally, it shouldn't be the business that rules us. As long as the best systems don't succeed, whether they are computers, stereos, or whatever - as long there is something wrong with the whole way things work. Some people may say: "we can't help it - so let's just follow the others..". But enough people *can* make a difference. If we want to keep something alive - we can.

If it's worth it.

: >computers avaiable. By people abandoning the ST and moving over to the PC we
: >are moving towards and single computer market. How could this be good??

It's not good at all.. Our problem is this: the current commercial world
just doesn't treat "alternatives" well. Profits are everything, and
being an enthusiast means being a fool. Unfortunately, most of those
people who don't need Ataris (and other machines) around, haven't used
ones - and in their eyes, we really are fools. They can't understand
what this is all about. I can't blame them - but it's sad. We have a
whole generation of kids and elder people who can't understand the FUN of
using Amiga or Atari. For them, professional Windows-world, and the
mammoth applications, are what computing's all about. Serious business...
Very serious, sometimes.

: I'm not sure who your message was pointed at, but to make you, (and others)
: absolutly sure, i do the best i can to get software for our Atari platform.
: As you said yourself, a single computers market isn't good at all, and
: specially not when it's based on MS developements. I'm not sure too much
: software support is that bad at all, but i hate seeing everything beeing
: developed on the wrong, (wrong in my opinion) platform like the PC.

We must act together to survive. Otherwise there will be one alternative
less, pretty soon.. If enough people want TOS computers, they'll get those.
If not from Atari, then from somewhere else..

: >Let's do our best to work together for the computer industry as a whole and
: >not get caught up 'Mine's better than yours' arguments. They waste time,
: >reduce choice and cause hostilities. We are all computer users and the
: >end of the day are we not?

I like to think that way. It's just easier to think that way when you
belong to the majority; nothing threatens you. Far too often, it just
happens: you meet a PC/Mac owner, and try to discuss things as you were
equal. In a few minutes, you may see that you're _not_ equal. The other
side just laughs at you, or doesn't bother to talk at all.. Because
you're not to be taken seriously: you own a wrong computer. I believe,
we all know these attitudes - and how irritating that is. It's hard to
defend your choice every **** time you meet someone. I guess, this
creates a "ready to defend" -attitude. You expect trouble - and behave

therefore aggressively yourself.

This has happened here, too. I'm sorry for possibly insulting some of you here with my messages. It's not right. Defending your favourite computer shouldn't create aggressions. Computers are just computers, after all.

: We sure are. But we have to discuss our feelings once in a while, and
: perhaps some developers are out there listning and may get some good ideas.

I agree. Sometimes I just wish that more developers would write their opinions here.

: Greets
: Kim

Cheers,
TH

: corrupted. the source file is not corrupted because it plays back with no
: apparant glitches.

I'm not entirely certain about this, but: it seems like DMC (Calamus developers) at least thought that there is a bug in TOS that affects copying very large files. There is a tiny fix-program available, too (sorry, I don't have my Falcon here - so I can't send you the fix..).

But another solution: get yourself KOBOLD - the lightning-fast file copying program from Germany! It's magic (not MagiC ;-) - really. Makes moving stuff from one place to another, as fast and easy as it can be!

Maybe some German reader could send this DMCFIX (or whatever it was) to you, or (even better) to our FTP-sites? If DMC allows it...

Greetings,
Tommi

Doug Little (dlittle@nest.demon.co.uk) wrote:
: General! We have intercepted a coded Imperial message from the Pekka
: Hietavuo system!

: TPH> houses have acted just like that when abandoning Atari- and Amiga
: TPH> platforms. They have taken the A&A programmers out of their 68000
: TPH> projects, and put them to make PC software instead in order to make
: TPH> more profit.

: This is exactly what happened - I was working at a software development
: house DURING this 'profit seeking' shift from the Amiga/ST onto the PC.
: They told us it was just an experiment to see how things went - but of
: course, it was more profitable to sell crap on the PC (since there were
: more of them) than it was to put some effort in and actually do something
: interesting on another platform. Needless to say, the PC became the norm -
: and you had to adapt to this or be ignored.

Yes, that's the way the real world works..

: When we formed BSS & started developing Apex for the Falcon, we got a lot
: of flak due to the fact that it didn't run on the ST or TT. We were told by
: many that it would not sell since it did not cover the entire range of
: machines and that there were not enough users to make it a profitable
: choice. Worst of all, the pressure was to drop it for the Falcon and
: develop it purely for the PC as it would sell more copies and in the
: process, become a more respectable product. What they were missing was that
: we intended to do a good job. Put some effort in, and write something WE
: would want to use when it was complete.

: It worked better than we expected.

I'm *VERY* happy to hear that =-) ! I guess, most Falcon-owners share
this feeling.

: So far, we have outsold all expectations on the Falcon - and although the
: market is quite small, the market SHARE is much higher than we initially
: expected. We have a large number of professional users dropping their PC's
: for Falcons loaded with Apex, both in the design and cable video markets.
: We have people using Falcons in conjunction with PC's armed with 3D Studio
: so they can work with truecolour animations which Animator PRO can't edit.
: Even the newest incarnation of Autodesk's baby looks like it's going to be
: hampered by the speed of the Windows and although it looks really good, our
: customers are concerned that a Pentium running Studio Animator in
: truecolour will not be as fast as a 16Mhz Falcon with Apex!. There are even
: a few who are using the Falcon in preference to the Silicon Graphics
: Indigo2 workstation simply because they find the Falcon is easier to use -

: even though it involves porting the images across and then back again
: afterwards!

That sounds really good! Just for curiosity: now, when Atari doesn't seem to care much about computers (at least, in public..), what plans do you have for Apex Media? Will you count on C-Lab Falcon (expensive, but apparently good), Barracuda 040 / Afterburner 040 -accelerators, Eagles or Medusas? Any plans for porting Apex Media to MagicMac?

What kind of systems do those Apex-professionals typically use? Do they use ordinary Falcons, or turbocharged versions?

How do you see Falcon's future, generally?

: TPH> but, above all, they must be able to satisfy all kinds of needs.
: TPH> Also minority needs. We'll get a very nasty world to live in, if
: TPH> money decides everything alone...

: Agreed. I would never consider completely ignoring a platform simply
: because I thought another one was better or faster, but the PC does cause
: me some irritation in this respect. It would make a fantastic competitor in
: a group of computer systems, but marketing and human behaviour has pretty
: much wiped out all but the Mac, leaving the PC to mould in a configuration
: not too far from it's original design.

I hope more people thought like you. It was rather sad to hear e.g. Dino Dini's comments about games for ST - and especially, Falcon.. =-(He didn't agree with you, it seemed. To put it mildly..

: When the Amiga and ST was commonplace, they were owned mostly by the
: younger members of our society. Lots of them played games, some of them
: mucked about with other stuff as well. A few got to grips with the machines
: and started writing programs of one sort or another, getting quite good at
: it - good enough to write software and games. At this time, programming was
: just that - you got out your programming language and created something. It
: was quite easy (if you knew what you were doing) and it was good fun in
: itself. These people became very capable at their trade and some went off
: into the world to do greater things.

: However, since the PC (and Windows/OS2 etc.) has come heavily into the
: fray, the process of development has become more difficult, less fun,
: prohibitively expensive and in some ways altogether frightening. Anybody
: who has used something like Borland 'C' (not bad by PC standards) or WatCom
: (different kettle of fish) will know what I mean. When I have to write
: something on my ST/Falcon/Amiga I think - excellent, something new to try
: out. If I have to do something on the PC, whether it be Pascal, 'C' or
: worse - 80x86 assembly - I think - sod it, not again...

: I wonder how this is affecting the arrival of creative new talent?

The commercial pressure is frightening. The competition is far too hard, I think. It doesn't encourage people to make better programs, but instead make bigger, fancier datamonsters (like Microsoft Word) - with

not enought time to debub them properly. Btw, what progr. languages do
you use on Falcon? Devpac 3/DSP? Lattice C ?

The computer world is just a photograph of the life most people live
today - especially in the U.S.A. Research has shown that most people
don't have nearly enough sparetime. They just work, work - and work.
Work through nights, weekends - and their best years. To be able to get
their kids to the right university - or just because a hard-working man
is a good man. There's little time for playing in this world. What you
do, must be profitable. In one way, or another. Is it such a wonder to
see that those same people want to bring their office PCs and Macs into
their homes ? And what do they do? Work. Of course. There's no time
for just "having fun with your computer" today... =-(Everybody's so
damn busy and serious today. I wonder, if there'll be going back to the
80's, when computing really was exciting - and fun.

: TPH> If "business" forces us to buy bullshit, it's time to say "no" !

: Yup. But it's hard for many people to see it this way. It's been too long
: now since the rot started.

Extremely hard, I've noticed! And it's not just the computers. How many
times I've cursed the inferior cassette decks, amplifiers, loudspeakers,
cameras, etc. of today! Sometimes it just seems like you can't purchase
a decent 3-head cassette deck, no matter how much money you put in it..
And why? Because most consumers just don't need real quality. So nobody
makes it. Neil Young was right in his latest album, singing about "Piece
of Crap" ! Everything seems to be plastic, piece of crap, today..
Rot, indeed.

: TPH> If I have to use a PC to get some job, I'll do it. But at home I
: TPH> will use whatever I _want to_ use. And that's Falcon. That's our
: TPH> own choice, whatever the business-brains try to decide =-) !

: And long may choice last, whatever it may be!

You just took the words right out of my mouth 8-) !!

And may thy software live well, and surprise the world !

Neither do I. But installing a switchable TOS in a MegaSTE is as easy as
1-2-3.

One needs a pair of 2MBit eproms (27C2001) and a switch. Shoot both
TOS-versions into the eproms, connect A17 to the switch (which itself is
connected to +5V and GND), insert eproms and have fun :-)

I have done this with various eproms and it works great. And even better if
one uses TOSPATCH to install some patches into the image as well.

BTW, MagiC[2|3] can be put into eproms as well.

There are special SCSI-towers available. They come as 1, 2, 4, or even 7 bay
units.

I installed my SyQuest and CD-ROM in a 2 bay one. It comes with all the
required cables, 2 SCSI-centronics connectors in the back, neat device
selectors, PSU. There is were even some holes in it, to mount a couple of
RCA-connectors for the audio-out of the CD-ROM.

I used the second centronics-baby to plug in an external terminator. This is a
great way if you want to take the package to another machine. No internal
fiddling with the resistors required.

I have a 1040ST which has been upgraded to 4MB. It comes with
many extras including both a color and b&w monitor. I will
also include an ICD SCSI host adaptor in a box with a power
supply and cabling. All you need to do is get a SCSI drive
to be ready to go. I had a 40 MB then a 700 MB drive in the
system, but I've kept the mechanisms. I just wanted to point
out that the host adaptor performed well for me.

I will also include a 1200 baud Hayes Smartmodem.

I have many software titles, but they might be out of date. I
migrated to MSDOS a couple of years ago and didn't keep my software
revisions current. This computer gave me several years of
reliable service. (sniffle)

Anyway I will take $200 PLUS shipping (I will ship according
to your instructions) or make me an offer if you think that is
too much. I will sell it to the highest bidder.

Please email, I don't read this group.

> Why is that handy? Why would I want to do that?

Terry, under normal TOS (everything but MagiC), fast-loading the last auto-folder TSR and the first DA can result in memory violations. This is an old problem that goes back to the release of TOS 1.04 and was never fixed. Under MagiC, I have not seen a sign of this quirk.

FELDAK79@SNYONEVA.CC.ONEONTA.EDU wrote:

> I've found the reliability of Atari hardware to be better than most other
> computer hardware I've owned.

Wow! I cannot say I had the same experiences with my Atari for 5
years. I had all sorts of problems.

In addition, the cases were simply "cheap" looking, the keyboards were
horrid (except on the Mega ST's, which were superb) and you had all of
those cables sticking out the end. All in all, I considered it to be an
upscale C64, not a downscale Mac.

> ST's Video - it was indeed a form of local bus video.

Define "local bus".

> it video but that was because it used RAM from the system to store its video.
> However, unlike CGA equipped PC's, the ST was able to update the screen and
> the CPU at the same time. This combined with the ST's efficient screen ram

It didn't _really_ do this though, it used 68000 dead-bus time to jump
in and grab the video while the CPU was doing other things. The result is
that the video ran quite quickly all things considered, but the total
amount of bytes that could be moved about was very low. The outcome of
this design is that the video resolutions were linked to bit depth, you
could only get reasonable numbers of colours at low res.

The result was odd, great performance for the time (almost ten years ago
after all!) but the system was locked into "lower" graphical displays.
This is an example of short term gain making the long term possibilites of
the machine a lot less than they could have been, IMHO.

Yes yes, I know it has more and better modes now, but they are still
"hard wired" and unlike the Mac, an app written for 320x200 runs in
320x200 - the price you pay for direct access to the hardware.

> The 1985 Mac+ didn't even have color like the ST and due to its video
> arrangement was up to 20% slower than ST. Let's not forget the ST's mono
> mode gave 20% more screen space than the Mac's screen either... :)

That's not true either. The video was simply smaller, they both used
the same system for accessing the hardware (bus dead time).

What made the difference was that the Mac was always running the fully
indirect QuickDraw at times, whereas the Atari rarely ran GDOS. With GDOS
loaded, the Atari was NOTICABLY slower than a Mac.

The long term result of this is that the Mac video is totally disconnected from the hardware, games that were written in 1984 still run great on my Q800. In fact, they run a lot faster because the hardware underneath is so much faster. VRAM, changes to the OS, 24bit colour on a 16" screen... the programs don't know or care. And there it is again, a little short term pain for long term gain.

> ST's disk drives - they used DMA (i.e the WD1772 FDC worked with the DMA
> chip for reads/writes). As a result, the ST had the some of the fastest
> floppies at that time and for many years to come. Because they used MFM

Good point, accepted.

> technology and an MS-DOS compatible format, they were able to read many
> types of disks the Mac+ couldn't. The Mac+ also used variable speed
> floppy drives that resulted in slower floppy access.

Actually, speed was not the issue that I can remember. The reason for this was better density, 880k vs. 720k

> ST's Sound Chip - certainly not the best. It was in fact the same chip
> that was used in the Colecovison game system. The C-64's SID was
> better but the Yamaha/GI chip used in the ST had stereo capability, ad
> noise generator and was still better than the Mac+'s 4 voice tone

Again the software makes the difference. Even a Mac + has a complete stereo drivers, polyphonic abilities (16 easily) etc. What the Mac lacked in hardware was MORE than made up by the OS's API's, which are simply superb. Although the Mac Plus's sound generator was quite simple, as you note, the system could in fact make 16 channel sounds in the background in software, and then mix it down the the chip for playback.

> ST-s Hard Drives - for a long time, the ASCI HD interface in the ST delivered
> very good HD performance. It dusted many circa1985 HD equipped PC clones
> and destroyed the HD of the 1985 vintage Mac+...

The Mac + had stinky SCSI, agreed.

> ST's interface - compared to the Mac+ it was childish but the ST didn't
> lock developers into anyone standard way of doing things either.

Which meant that learning one program didn't help you learn another - the whole idea of a standard. TOG wrote a great story on this, about a car manufacturer that installed the driver's seat backwards because it made backing up a lot easier...

The point is that a GUI is NOT easier to use unless you all agree on standards. In fact, you don't even NEED a GUI if you have the standards. If F7 means "save" in every application, you don't have to go to the manual for every application. If you know Undo is the first item in every Edit menu, you don't have to look around for it.

In 5 years of owning an ST, I saw nothing even close. Even the Edit menus we're standardized! And what does Undo key do? In STWriter it's Paste! All this needs is someone to sit down and write out a guide. No

one at Atari did this.

> GEM was available for the PC and it was thought that many applications
> would be available...

True, but yet another example of the difference between what could have
been if they believed in the ST, and what really happened. Is it just me,
or do other people think they sold this thing like a toaster too?

> PC applications to be ported over very easily. All in all, GEM wasn't a
> bad hack in 1985 - considering it was written in C and put into a
> machine that cost over $1,000-$1,500 less than a comparable Mac+!!!! :)

All true, but no lasting power.

> Oh yeah, one last thing - the Mac was under development by Apple for many
> years - the ST wliterally designed from scratch in less than a year!

Actually, this is true for the Mac as well. It was a skunk-works
project to "beat" the LISA.

> It took 4 months for Atari to prototype 4 custom chips which made up the
> core of the ST. All in all, considering the times and the financial
> resources of Atari in 1985 this is pretty impressive.

I have no argument against this. Let me be a little more direct...

a) Atari's hardware was a superb achievement for it's time - minor
arguments here. It was an example of how much you can do if pressed.
b) Atari's GEM OS had potential, but it remained undeveloped.
c) Atari went back on it's promises (GEM in ROM for free)
d) No development information for a long time
e) No standards docs.

I think everyone will agree with this statement, that sums up how I feel:

I think the ST was a great starting point for a long development of
Atari machines. Instead, Atari seems to have spent more time trying to
cut costs per box and pushing them out the door as game machines than
investing in it's future or new concepts. The result was that a machine
that was great for it's day suddenly looked very old. While Atari was
dropping the ball on the "Abaq" and TT, Apple was actually shipping 030's,
then 040's, and finally the PPC machines. It shows to me an almost
staggering lack of direction, forethought or vision.

Oh how I do! Remember, I _bought_ an Atari back then!

> You must be joking, are you ?

No, GEM is a joke compared to the Mac. Even back then. Long filenames, automatic document/application linking, standardized interfaces, suberb QuickDraw etc. Although GEM did a lot of things the Mac OS did, it was not as "rich", a point that everyone willfully ignores in these threads.

> Bullshit (sorry)! Mac was known to have such non-standard ports, that

This may sound rather odd, but I'm wondering if any place sells 1040 cases? Surely you must be able to buy them as spare parts?

1965. digital audio, HELP me please!

Newsgroup: comp.sys.atari.st
Date: 1995-05-01 00:00:00 UTC
From: markw@southwind.net
Message-ID: <3o3g6t$arc@onyx.southwind.net>
Source record: 166494

I'm new to the world of Atari. I would appreciate any information on digital audio recording software/hardware for atari computers. I'm trying to keep my options open for deciding on which computer platform to use for this task. I will be using an Amiga for sequencing, and am currently undecided on what to use for digital audio.

thanks!

According to the "announce-0.08" file, the way that values are returned
from system calls was changed, and breaks the 4.5.19 (and prior) shared
library, and all existing statically-linked programs created on prior
releases.

If the versions on the CDROM predate the 0.08 kernel, they will have
this problem.

>Well, I got "mount" to work & "cp"ed all the files over, except for /dev
>That just won't copy. I noticed the MAKEDEV file in there but it can't find
>some external prgs (pids?) it needs to work.

You can't use "cp" to copy device nodes, they must be created with
"mknod" (which is invoked by the MAKEDEV script). Some
versions of "tar" know how to copy device nodes, though.

>Anyway when I try to boot into the hard drive it seens to lock up! No error
>message at all. Gets to VFS: something (minix) then just sits there &
>blinks the drive light all day. No fun! :-(

I'm trying to bring up Linux 0.9pl5 on my TT and so far have not been
having much luck. I hope you gentlemen can help.

I have a TT with 4 megs TT RAM and 4 megs system RAM. I have an internal
SCSI hard drive, and (currently) an ACSI hard drive and a streaming tape.
I'm planning on moving the ACSI drive over to SCSI as soon as I can get
a cable.

I can bring up the 0.9pl4 kernel and ramdisk. However, the 0.9pl5 kernel
does not come up at all; after the "Booting Linux..." message prints, the

machine just hangs with no messages at all. I've tried both the 0.4 and 0.5 revisions of the bootstrap, with the same results. By the way, the 0.5 version bootstrap boots the 0.9pl4 kernel just fine too. I downloaded the 0.9pl5 kernel a second time to make sure it hadn't been corrupted, and got the same results as before: nothing.

Also, with 0.9pl4 kernel, if I use the ICD software to run my hard drives, then Linux reports a SCSI timeout on the internal drive, prints a message about resetting the SCSI bus, and then hangs. When I use AHDI 4.06, Linux successfully reads the partition information from the internal drive, but does not find the ACSI disk drive or tape (reports "0 ACSI devices"). When I used ICD's software with the internal drive bypassed, Linux read the internal partition information, saw the ACSI drive, but reported that the sense information seemed invalid, and then ignored it.

What I'm wondering is, since you've got the 0.9pl5 kernel to at least come up, how your configuration is different from mine, and what I might try to get it to work.

Thanks for any suggestions you might have,

-Greg

> Any historical Atarians confirm or deny??

Nope, the 354 was the SS drive. The 314 is the DS drive. I've still got one of those "historical" Atari's as my everyday computer. 520STM with a XTRA-Ram 2.5 Meg upgrade, a SF314 and an SF354 with a double-sided mech from a 1040STF that's not working right now (bad power supply), a MegaFile 30, and an SC1224 monitor. I also have a LineLink 144e modem and a Panasonic KXP-1091i 9-pin printer thrown in for good measure and getting ready to add a Star heat transfer color printer to the mix for better output with AtariWorks and SpeedoGDOS for those lab reports for school. <g>

Well from memory there were some 3 computers that had better features
than the Atari ST, at that time...

MindSet was developed by Atari people, use a Intel chip and had graphic
proccers, was on the front page of a Byte Magazine, 1986..??...

Amiga also developed by Atari people, had better sound(Atari stuffed up there
new AMIE? sound chip) and better graphics and could multitask from day one...

Lysa/Mac was also out at the time...

Atari ST was at a low low price and that was the only thing going for it,
and came out with a single sided drive and TOS loaded from disk...

Yes I do read mags and books and no I am not a Atari bigot and don't suffer from
tunnel vision....

Lighten up lads and find out what is in this real world....

Maybe I can show you how to turn a sows ear into a purse. You are going
to need to spend money to do what you want. Since New Zealand has no
dealers, you will have to send away for what you want. The procedure
should be easy to accomplish, with a little how-to advice. I would
contact someone like toad@charm.net and get their best advice. The new
Simms upgrade system can be done for about $150 US$. Drop them a line.

The MindSet was in fact an MS-DOS compatible machine that came out back in the mid-80's - 1984 I think. For its day it had incredible built-in graphics capabilities - 640x400x256 - I mean, real high end stuff considering that most PC's still had CGA boards. The Mindset also had built-in gfx support hardware to give it fast graphics and other capabilities.

If I remember correctly, it didn't succeed because it was expensive relative to other PCs and it wasn't fully PC compatible - ie. it failed to run certain "business" apps that were acid tests for PC compatibility.

I don't know much about the system besides that although I'm sure that it was related in some way to the Amiga-Loriane prototyle shown in the 1984 Winter CES. Essentially, the machine was nice and way ahead of its time but seeing as there was no graphic art market niche back then, it didn't matter...

This is a single sided 360k disk drive. You will need to keep that in mind when you buy software for the computer. Since you are on-line now, I presume you could download some stuff from internet. Try some public domain games, etc. You have 512k RAM machine, unless it has been internally upgraded. You will find lots of fans, and suggestive help here in this group.

You'll also need a program like X11 to use your ST as a X terminal. This
needs MiNT anyways, so you might as well install MiNTNet for the
PPP/SLIP, and X11 for remote Mosaic running.

NEITHER is a rather encompassing word. We have published since 1984 and currently are putting together issue 92 covering the goings on with NEW programs and NEW hardware being developed to meet the needs of a hungry alternative computer platform like Atari

Don't pound the nails into the casket just yet, there is a whole lot of second generation computer enthusiasts coming into their own, who read our magazine, get some tips, call for suggestions, and continue to enjoy their new "Alternative Computer Platform" computer. When the slickness of a good running system gets appreciated, you get an "Enthusiast" or as some say "Cult Computer User". New users should call us for help and advice. We don't mind as long as you call our support line (503) 476-0071.

I run a USRobotics, 28.8, V.34 on a FALCON all the time without any problems. Mostly 28.8 connects, locally and 26.4 and 24K long distance. STalker 3 is my software and if I remember, I had to change the port in the setup so it would accept the higher speed. That is the Software's problem, not the FALCON's.

Hello Andreas,

Latex2e will run with any TeX-package for the atari, since it is only a
macro package, just as the old Latex (now Latex2.09) was.
You can get Latex2e from "ftp.dante.de" in "/pub/tex/macros/latex/base".

MagiCMac is a MagiC compatible operation system for the Apple Mac.
MagiC is a TOS compatible OS for the Atari ST/TT :-)
So, MagiCMac is a Atari compatible OS for the Mac. Many GEM-based
applications can be used with a 68030 or 68040 Mac. It's great.

So long, Sacha

Bob,

I'm not sure if I would place all the blame on Atari. How many companies have sucessfully marketed a non-PC compatible computer? Commodore failed. Coleco failed. Texas Instruments failed. Digital failed. MSX failed. Only Apple has had some sucess and I personally feel they may be headed in the same direction as all the other companies (I hope I'm wrong on this).

The PC standard is just too strong....

: >It refuses to do anything with LaTeX!! How do I get TeX to use the LaTeX
: >package?

: tex &lplain file
: ^^^^^^ After the ampersand you specify what format file TeX
: should use. Of course, you make an alias for that.

Remember that you are on a UN*X-system where the & is a special
charcter!

tex '&latex' file
will do the job. (If you are using the new LaTeX2e, Remember:
You will need a Big-TeX to do that.)

(I have a file called latex:
#! /bin/sh
tex &latex $1
which does the work for me (to old to remember about the &))

There are two 6850's in the Falcon (in the ST too). When I fitted my PowerUp I had the same problem with the software (TOS or CPX versions) having no effect on the hardware. The instructions suggested connecting to the 6850 on the right hand side of the motherboard but the software addressed the 6850 on the left hand side! The wire (can't remember which one it is now) must be connected to the same leg on the 6850 which sits at the opposite side of the board to that suggested by the instructions. If in doubt, talk to Tony at the Windsor office or email ssolutions@cix.compulink.co.uk.

No problems at all. I tested a Hayes 28k8 no long ago. And since the serial
port on the Falcon can handle 115.000 DTE baud, it suits a V34 modem
just fine. I manage to get very fine CPS rates such as 11490 transfering
straight ascii files between two Hayes 28k8 modem were both machines was
running 115000 DTE baud. Compressed files, (such as .ZIp and .LZH) i got
just around 3200 cps.

Thats the main problem right now, as we can't even agree, (well some of us
can't). How can we expect the developers to know what to do when the users
don't agree. On the other hand, it doesn't hurt telling wishes.

>: We sure are. But we have to discuss our feelings once in a while, and

Me too. I bought my 1040STf in Feb. '86, and it's still my only computer (ouch!). Of course, it's now got 4M of RAM and a 1.44M disk drive with an interface card, but that's it.

Every day, I'm amazed that this thing still works. It still has the original power supply, too.

PF> there which she could use to get the doc's back. Thanks.

She could try using KnifeST version 1.03. It includes an UNDELETE.TTP
whichshould be able to recover the files unless she's subsequently written
something to the diskette. If she has, the chances of recovering the files are
very slim. Diamond Edge has the same type of utility and is a bit more modern.
Wish her luck from me!

US> This is nonsense because you cannot use the DSP to make the operating
US> system faster. The DSP is limited in its range of applications to
US> funtions that profit from special features of a DSP directly. TOS or GEM
US> or MagiC are no such applications.

My information on this particular point is second-hand but from a source that I would, generally, accept as reliable. I'm not much of a programmer myself so I'm not familiar with the details but I_was_ under the impression that the delay is due to the intricacies of the DSP chip. If that's wrong, I'm sorry.

US> Do you think those who have an ST or TT and which can run MagiC 3 NOW
US> think this was stupid, too? Don't forget that most users have an ST.
US> Falcon users are a minority.

Granted but, as I've said before, Falcon owners have been sitting here for over a year now waiting for a version that was Falcon compatible while ST/STe owners are now up to version 3 and MacIntosh owners have gotten their version (even if it is based on v 2), as well. Stupid was perhaps a strong word to use in the context but I still think it's precisely that in the context of customer relations. Again, done is done and I don't really feel like getting into an argument about something I can't change.

BTW, I want to thank you for HDDriver. I installed my copy a couple of days ago and it's done lovely things for my boot up time! I haven't been able to get TCache working properly as yet but I'm sure it's just a question of time. Nice program!! :^)

The Atari ST also was Computer Of The Year in 1985 (or maybe 1986) for the editors of "Chip", a very renowned German magazine. No doubt, the Atari ST won high accolades in the mid-80s, and rightfully so. It was largely superior to the PCs of that time, and it could rival the Mac, but for a much lower price.

But at a much, much higher price.

: > local bus video (for very fast graphics)
: Uhh, no, doesn't it use the DRAM for video?

It did, but it still is local bus video, i.e. the video chip is connected
very tightly to the processor bus for maximum performance.

: > a very fast HD controller
: The WD unit used in PC's all over the place at the same time.

Yes, and I remember that you had to use interleave 1:3 until 1987
on those PCs because they weren't fast enough. The ST's DMA chip
gave you interleave 1:1 right from day 1, with the basic machine.

: > fast and flexible floppy drives that used DMA
: They did?

Sure. DMA for both floppy and hard disk transfers, unlike PCs or
any Mac of that time. Mac started to have dedicated hard disk DMA
in the early 90s!

: > and a decent sound fx generator.

: The sound chip was one of the things I hated the most about my ST. The
: C64's SID chip was at least as powerful.

Still, it was much more than what you got from a bare-bone PC or a Mac!

Close! I believe limitmem actually tacks some bytes onto the *end* of
the program file. I can't remember offhand if there is enough space in
executable headers for a memory limit value.

Falcon owners _have_ gotten a rough deal off the MagiC developers... Are you honestly saying there's more moneyin a *Mac* version than a Falcon compatible one?

We're not even talking about a Falcon enhanced one - I just want a _compatible_ version...

And no, advance orders won't spurr them on. In the UK, System solutions _refuse_ to sell the latest version until it's Falcon compatible. And good on 'em.

Brian

2009. High Speed Modem on Falcon

Newsgroup: comp.sys.atari.st
Date: 1995-05-02 00:00:00 UTC
From: jmercay@dinews.epfl.ch
Message-ID: <3o4jii$cis@disunms.epfl.ch>
Source record: 166359

Hello,

A friend of mine want to buy a modem for his falcon. An V34 (28.8Kbps)
would be great. But can the Falcom handle this speed? As I know, the machine
has only a 16440 UART :-(And we can't replace it with a newer UART 16550 ...

Had anyone tested these modems on a Falcon ? Which was the avergage CPS, and
what software to use? (BTW, GEW is limited to 19.2Kbps :-(

Thank in advance,
jm

I paid $579.00 (ouch!) for the Mighty Sonic board. The 32mhz dosen't make a lot of differance but when you run applications in fast ram things really fly. If you have used a DX/2 66 you will have a good bench mark. The bad part is that it is not compatible with all Falcons. Atari uses various chip manufactures and this I am told caused compatibility problems with the hardware. There is a document called Chips172.zip that goes into detail about this. The Barracuda will get here. How long did we wait for the Falcon? I have talked to Steve at Wizztronics and if they don't go bankrupt this will be the ultimate upgrade for the Falcon. Of course it goes without saying that you have to be an Atarian regardless of cost.

Michael Grove in sunny California.

Mike; The best thing to do is contact Toad Computers WWW site. You
can view the specs on the Falcon and brouse their software line-up.
Not trying to promote just one dealer though, if you subscribe to
Current Notes mag or ST Informer you'll find plenty of dealers and
I personally try to use as many as I can to help support the Atari
retailers. Have you not heard of Cubase Audio with Digital interface
of up to 16 track of hard disk playback. You're going to have fun
"catching up".

Ditto for me. I've look for PD fonts but there arn't any. There are many
commercial fonts and because Calligraphy is no longer in production they may
eventually be released to the PD but don't hold your breath. I think they
ought to release the specification of the format that they use so
that people can write a converter to Calligraphy format fonts.

>Does anyone know if GFA Basic 4.x is available and who's developing it?
>Also I'd like to know where it can be bought or the adress to the author?

While we still hear the same old rumour every few months about the Richter Company in Germany developing an all new GFA BASIC 4.0 for the Atari, we never see anything from it. The last semi-reliable word that I got was that there were so many legal wranglings between GFA Systemtechnik and Richter that they decided to drop the project. The depressed Atari market probably didn't help matters any either, I reckon.

GFA's US office closed last year but they do have a US distributor now:

PTR Precision tech. Inc.
Phone 203-741-2281
Fax 203-745-7932

The bad news is that (I am told) they do not distribute the Atari version of GFA BASIC, only the DOS and Windows versions. The last version of GFA for the Atari was 3.6, which was identical to 3.5 but included some hooks for the TT. I found it to be less crash worthy on my system so I stuck with 3.5, but many others reported no problems whatsoever. Go figger.

From: avg@cwi.nl
Message-ID: <avg.799430514@news.cwi.nl>
Source record: 166382

Just kidding (the title suggests a relation between two entirely
different questions):

1. Ataris and 3-button mice. Can I use a 3-button mouse that is
connected to the joystick port? One that is connected to a serial
port of the TT? With MiNT only, or possibly also under plain TOS?

2. X11R5 for MiNT. Are there any xmodmap files available for a UK
keyboard?

3. X11R5 and .xinitrc - it seems that X doesn't understand DOS style
newlines. Shame. Took me hours of headache to find out. Is X11R6
any better or does it still have that quirk? MiNT may not be TOS,
but if that means not accepting the CRLF sequence, I think that it
should rather be `not done'.

hope your day is as nice as this one here in Amsterdam,

I have ;-)

Very nice peace of software, considering the early version. I mailed this one
out to Danny and Chris, so look out for it at HENSA and CIX.

Alexander needs some encouraging words to keep up the work. Anyone interested
in a further development should contact him at

aclauss@rbg.informatik.th-darmstadt.de

ATM, we're discussing what could be added in the future ;-)

Bye.

I don't wan't to sound too discouraging, but IMHO you're waisting your time.

Nice effort, though.

BTW, OverScan have developed a hardware add-on for all the MACs with a
PDS-slot. It gives you true ST-compatible serial and parallel ports and even
all the MIDI stuff is there.

Bye.

It was none other than Tommi Pekka Hietavuo who did write on 25 Apr 95 that
....
TPH> Does the above mentioned game run on Falcon? Does it need
TPH> Backwards -program in order to run?

Yes it does ,and faster too , the main setting to look out for is to limit the RAM useable to 2 meg (The same bug that made it unstable on the ST with >2 meg here) with backwards. Caches can be left ON ,CPU and blitter are set to 16Mhz (or 32 <Grin>), set all the other switch's to STE modes as they don't affect the spead anyway and leave GEM and HARDDISK ON then make resident. I find it is even more stable on my Falcon than it was on the ST which would sometimes crash if I had a huge rail network or too many trains running ,doesn't seem to happen on the Falcon (so far anyway !).

It was none other than Requiem who did write on 25 Apr 95 that ....
R> I'll have my new hard drive tommorow (SCSI external, 730meg) for my
R> Falcon and all I'm wondering is this:-

ahhha ,another Quantum LT730S ,good price 170UKP+vat :-)

R> 1. If I remove my internal IDE will it still boot from the SCSI
R> external? 2. And if so, do I need to partition the SCSI starting from

Falcon boots from SCSI ID#0 no probs but there is a slight delay as the falcon
search's for the non existent IDE to boot from , there are a couple of ways to
fix it though if need be (little patch's) but the dealy is very small and I
don't think it will bother you IMO.

R> C: ? 3. And if so how do I copy my files from the IDE to the SCSI
R> without clashing the partition names and without using floppy disks.

You just partition it up (remeber there is no 32M partition size limit on the
Falcon like the ST .. IIRC its now up to 512Meg)and attach it and the logical
drives and automatically re-assigned as they are found. IF the IDE is in the
(CDEF) then the first SCSI partition would be G....
with out the IDE then the first would be C ...etc without any driver changes.

The only limit with TOS itself is logical drives (Paritions)after letter P:
are not accessible from GEM.

Oh one final thing ! GET HDDRIVER it is by far the best harddisk drive software
for the Falcon.

WW> To uncompress use: gzip -d filename.tgz
WW> Then use tar to untar it: tar xvf filename

thanks ,as you can imagine I got a few replies to this and all is sorted now
.... err except I cannot get 'make' to work properly now :-)

If the makefile has the following line in it

include ../dirs

what does this need to point to ??

I get error when running make

make : fopen ../dir file not found
make : *** not rule to make target `../dir stop

and the process ends.

I try pointing to the current directory (where the source files are) and get
the same fopen ../* file not found error line but the compile seems to continue
otherwise but am not confident that it has worked properly until I know the
reason for this error ?

> should rather be `not done'.

Are you sure about this? I'm almost certain my .xinitrc has CR/LF's in
it --- one of elvis's slight annoyances. IIRC (I'm at the office, so I
can't check), xinit invokes /bin/sh to run .xinitrc; perhaps your sh
doesn't handle CR/LF's properly.

>hope your day is as nice as this one here in Amsterdam,

Well, reasonably nice at least; it was kind of overcast this morning,
but it seems to be clearing up now. ;)

2049. Falcon with 32mhz

Newsgroup: comp.sys.atari.st
Date: 1995-05-02 00:00:00 UTC
From: operator@civpczaal.utwente.nl
Message-ID: <3o61qe$mjm@driene.student.utwente.nl>
Source record: 166399

Hello!
At my first time at the news-group and my first time in English I have 3 questions:

1) I will accelerate the cpu - and may be the hole bus-system - of my falcon, like the SKUNK32/36 from ComTex of the Speed Resolution Card from Hard&Soft.
But I don't have any platine-lay-out. So, which signals must I have and where are they? I guess one from the soldering-points at U65 and U41. And how to slow downfor synchronous write (and read?)? Can I take the 32mhz from the DSP?

2) How can I read ,starting from the InterNet, the atari news-groups at Maus-net and Fido-Net?

3) The Turboass1.77 is a pretty goed assembler but doesn't work on the falcon. Is there a falcon-proefed version of Turboass?

Tschuess

>os/2 is almost a bad ..but also as dead in the water as TOS as far as user base
>is concerned ..despite a MASSIVE ad campaign and at least a 6 month lead over
>the Microsoft offering it is a complete non event !!

Yeah right. The OS/2 user base is approximately the same as the TOS user base. I suppose 10 years ago you thought 1 meg was approximately infinite memory as well.

OS/2 use is growing. It's user base will soon surpass Macs. Heavy advertising for a few months can not over come years of M$ monopolistic practices. I've been going to the Spring COMDEX computer show for the past several years. I have seen OS/2 support by vendors at this show (it's a HUGE show) grow dramatically. I've seen TOS/Atari support dwindle from virtually nothing to nothing.

> KA> What alternatives do we have on our Atari ?

>TOS,MINTOS,LINUX,0S9,OMEN,MAGIC (okay not strictly an alternative but as much
>as Windows is to DOS),MROS,That cartridge port multitasking system (Can't
>remember its name now), bound to be loads more I haven't come across.

The hardware it runs on is dead end. A 16 MHz 68030 crippled to a 16 bit data bus doesn't cut it anymore. Welcome to the 90's - a time for internal FPUs, faster external clocks, internal clock acceleration, RISC and CISC CPUs, 32 and 64 bit data buses, ...

I have for sale a 4 Meg Mega Ste. It has a 50 meg hardrive and a high density floppy. The monochrome monitor it runs on is also for sale. The computer is in great condition (Not used much). Also for sale is a migraph compatible type hand scanner. It is a black and white scanner and can scan up to 400 dpi. Will run with touch up. Lastly, I will sell the following software packages with this system.

Calamus 1.09
Word Up 3.0
DynaCadd 2.something, (2D version)
NeoDesk 3 (lost original disks)
Over a hundred disk of shareware software (mostly from magazines) (some of the magazines are available too if wanted).
The following commercial games are also for sale...

Infestation
metro
hostage
combat course
oips
ninja
batman
robocop
menace

I will sell this whole package for $1000.00 dollars Canadian. You can contact me by email at 3ws5@qlink.queensu.ca
or by mail at 29 hamilton st, kingston Ontario, Canada k7k 1p1. if interested, I will get in touch with you by phone.

>a 486dx2/66. and 8mb ram of course. Windows is slow indeed. I HATE
>windows.

It was the fastest the budget I had would allow at the time and still get
everything else I wanted - 8 MB was included. Anyway, a DX2/66 is not
significantly faster than a DX33 for _most_ tasks since getting the info
into/out of the CPU slows things down for memory intensive apps such as
WP.

>:Try Linux :-)
>
>indeed. prepare to get more ram as the 8 you probably have(at most) is
>only just enough.
>Linux with 4Mb is as slow as Windows, I guess, certainly on such a sluggish

Would anybody sell me for a reasonable low price his unused Cubase programm (or equivalent) running on a Stf-1040 (mono)? My boy (13) is interested to connect an old ST with a Yamaha keyboard.

Please send offer or suggestions to pfennige@scsun.unige.ch

2057. Re: ST PD game recommendations...

Newsgroup: comp.sys.atari.st
Date: 1995-05-03 00:00:00 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HQ2CJL4JTU8WW22N@SNYONEVA.CC.ONEONTA.EDU>
Source record: 166251

There really aren't too many PD ST games for the simple reason that these kind of programs are often more complex to write than basic utilities and usually involve more people, etc.

However, I can recommend many fine ST games that are available as Shareware (you try before you buy). Where possible I made note of STe and Falcon compatibility. Please feel free to add to this list.

1. Violence - awesome Xenon 2 clone - ST & STe
2. Mrs. Munchie - super mrs. Pacman clone - ST, STe, F030 & 1meg
3. Insectroid - very good Galaxian clone - ST, STe, F030
4. Megapede - good millipede clone - ST, STe, F030 & 1 meg
5. Kid Kong - excellent Donkey Kong clone - ST, STe, F030 & 1 meg
6. Centipede - the best Centipede clone! - ST, STe, F030 & 1 meg
7. Cudlee's Quest - decent "Mario" clone - ST, STe, F030
8. Droid - cool arcade shooter - ST, STe, & F030
9. Berserk - cool ve rsion of the game - ST, STe, & F030 & 1 meg
10. Tetris - very good clone of the classic game - ST, STe, & F030
11. Kid GP - good Parasol Stars clone - ST, STe, & F030
12. Megaroids - old PD Asteroids clone but very good - ST, STe, F030

Whew! This is all I can remember at the momment as I no longer have my STe or F030... NOTE: Assume that you will need Backwards to run any of the games listed here on the F030...
I did the art for games 3,4, & 7 but as I don't see any of the registration money (never did) you needn't feel obligated to register these progs...

Finally, some of these games can only be found in PD and SW disk libraries while others can be found via FTP.

That's news to me. NIM: Operating Sytem Utilities states that the year in
a date/time record can be anything from 1904 to 2040.

I would imagine that by the time 2040 rolls around, the system software
would have already switched to using the long date record format which
supports dates between 30081 BC and 29940 AD! I don't think I'll be caring
about what they do with mac time formats when 29940 rolls around :)

Maybe you should try to disable the DATA and INSTRUCTION caches; if the drivers
hqve self-modifying code, this could be the reason why it does not work
(anyway, the PAK does not give much power without cache!)

I get this to run by selecting an overscan .INF then changing rez to
ST low and the program runs fine. I reckon it leaves a bit of memory free
above the screen and stops the memory error when the mouse goes off the
bottom of the screen.

As I remember, it, the Tweety simply split out the channels, one went to
the left speaker, one to the right, and the third was mixed into a
"middle". Nothing spectacular and nothing in the chip was in stereo, but
if the programs were written to take advantage of the card, you could get
some good effects. The problem was that I had never come across a program
that used it.

Still, a neat idea.

> You're right that Atari did make a mistake in not publishing established
> interface guidelines for GEM. However, I think they also wanted to
> have programs appear as fast as possible for the ST - as GEM documentation
> was always sparse, this lack of a standard only helped get things released.

I don't really understand this comment. With the Apple docs you go
"Hmmm, how do I make a Window" and they give you a complete example that
includes not only the code, but the interface. With the ST docs you got
neither. Certainly didn't help!

> You're also correct in the ST's screen display being slow but that was only
> under GEM

GDOS actually.

> - as I'm sure you'll recall much of GEM was written in C and many
> parts of TOS were far from optimized. When programmers began to learn to
> write directly to the screen, things really screamed (remember TEMPUS?).

Which of course make it difficult or impossible to take advantage of
anything that came along later. Games written in QuickDraw on the Mac DID
run a little slower "way back when", but the result is they still run
today. Games written on the ST that drove the screen could not run in any
other modes, including those on the TT's and such.

> The ST's video RAM organization, fast CPU, and good video architechture
> made the ST's graphics very fast - except when doing screen blits of large

Yes, this is all true.

> Although I didn't realize it at the time, Atari killed the ST series very
> soon after release for the simple fact that they did not make it EASILY
> expandable/upgradable.

Agreed.

> The Megas came out almost 3 years after the ST line
> made its appearance - by that time things were already starting to sour.

I always thought the Mega was the best bit of hardware for it's time, in
terms of case design. Instead, Atari goes back to the poor 1040 case
design for all newer models, and makes a truly HORRIBLE case for the TT.
All of these chould have been done in the Mega case style, which was
rugged, compact on the desk, had lots of room inside and a great keyboard.

> In their defense, I remember hearing that part of the reasons for the delays

>money selling video or sound cards. :^)

Well of couse, if you don't multitask you wont need that much power to run
applications. And i'm sure you would like to upgrade as soon you start to
use several programs, just like every others.

The reason why upgrades and extra cards are so cheap is because they produced
in a very high amount, and they're sold too. On our Atari we find 3th part
upgrades as very expencive due to the low amount of people buying it.
The problem i have with this is that i can't find any profit it in. I'll
say making a cheaper upgrade (like the T28 for the ST or perhaps Baracuda
for the Falcon) would make more people buy the product. But they'll have to
lower the price. And this would also benefit the whole market as more people
would stay longer at their equipment, insted of changing to another platform.

There are several files you need :
a kernel specific boot program (ataboot4.ttp or ataboot5.tty)
then#
if you just want to make sure it works on your Falcon you will need the
RAM filesys. Then run by giving the loader the commands -r filesys

otherwise you need two rather large gnuzip files for the system software

Good luck to you if you are trying to get up and running on the Falcon -
I've been trying for weeks but still have had no success

Steve.

Yes, it's a good start. Do send your comments to Alexander please, so that
he knows how to improve it.

>Restrictions: Only bitmap fonts (no outline)

It's the other way round. The bitmap font support is rather non-existent; you
should use vector fonts if you can (NVDI/SpeedoGDOS).

>Haven't tried it out yet, but I will... ;-)

It works fine with the example html-files.

Harddiskrecording Interface For All Atari Computers with ACSI!

There is a new harddiskrecording interface for all (!) Atari Computers with ACSI Interface (so all except Falcon and ST Book (?) or Stacy (?)). It's a modular system consisting of the main board, an interface board and optional A/D- and/or D/A-conversion boards. For a basic system you need just the main board and the interface board.

The main board contains the transceivers for the S/PDIF signal (coax in, coax out, 2*opt. in, 1*opt. out) and a buffer for the audio data.

The interface board contains some glue logic to adapt the main board bus to the Atari ACSI. Other systems such as ROM port, Apple NuBUS, ISA, PCI are possible but not developed yet.

You will need a CD player or DAT recorder to work with the basic system. So what can you do with it? It's possible to record and playback on the digital level, so you can use it as 16bit stereo sampler or harddiskrecording system. If you have a powerful machine (68030/32MHz and up) you can easily do realtime effects (which are e.g. in the Falcon done by the DSP). Another application is the use as streamer if you own a DAT recorder (not DCC or MD because of their data reduction!) or another PCM studio system.

What about the software? That's the point! There is a low level driver which interleaves the harddisk access with the harddisk recording interface DMA so that even if you run a program like KOBOLD there will be no dropouts or malfunction of the harddisk recording interface. I also have developed a basic interface for the PAULA MOD-player. So what's missing is harddisk recording software. I already talked to the developer of a harddiskrecording software who told me he will support me. For demonstration purposes there is some software to record and playback in a pure format and in a format similar to DVSM (it does realtime compression on my machine) and GUI software for recording/playback in pure format and for streamer purposes.

So if you are REALLY interested do not hesitate to send me a email! If there are no serious requests this system will never be sold!

If it will be sold the basic system will cost perhaps around 1000DM. I think this is a fair price if you have a look at the few really good sound boards for IBM PCs (1000DM - 1800DM/$700-$1200).

> mail would be gratefully received.

The sine table is a four quadrant (ie., one full cycle) table, in 256 entries. The Mu/A table is also 256 entries. Both share the same addresses, but one is in X space, and the other is in Y space.

Sorry I can't be more specific, but my 56k data book is in Ireland (along with my Falcon :'( ).

You can get the data *BOOK* (approx 300pp) from Motorola in Milton Keynes, UK for about 15GBP
-- ask for the "PROGRAMMERS reference guide": this book has the instruction set, memory/peripheral map, and peripheral registers in it. Be careful not to get the hardware reference, all you'll get are timing diagrams!

The answer is 'yes' the notation part of CUBASE SCORE is additional to
all sequencer functions and I like working with it very much.
If you don't need the notation part: As far as I know you can still get
the version CUBASE 3.0 (or3.1) which should be cheaper than the SCORE
version.
You can e-mail Steinberg Support via Compuserve Gateway. They should be
able to give you the latest information about the different versions. The

2082. FS:Digidesign Sound Tools for Mega ST

Newsgroup: comp.sys.atari.st
Date: 1995-05-03 00:00:00 UTC
From: drichard@execpc.com
Message-ID: <3o6sfb$dct@homer.alpha.net>
Source record: 166330
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.advocacy

For Sale: Digidesign Sound Tools system for Atari Mega ST. Note, this system REQUIRES a Mega ST because the DSP board plugs directly onto the Mega ST's bus. I paid over $2000 for this system, and am asking $450 or best offer. It's in very good condition and comes with original manuals, etc. If you're unfamiliar with the system, here's what it does:

The Digidesign Sound Tools system is a hard disk digital audio recording, playback, and editing system. It can be used for mastering CD's, tapes, etc. or for editing digital audio. The system I'm selling consists of the following 3 components:

1) DAT I/O digital interface for doing direct digital audio I/O (entirely in digital domain) from DAT, Mini Disc, DCC, or a CD player that has digital output. It has both AES/EBU and S/P DIF ins/outs. This is a separate box with cable that plugs into the DSP processor described below.

2) The Sound Tools DSP, a Motorola 56001 DSP processor on a 'card' that plugs onto the Mega ST bus. This processor speeds up DSP functions, and allows things like realtime EQ during playback.

3) The Sound Designer II software. This is the software that drives the hardware described above. In addition to recording and playing back digital audio it includes cut and paste editing, scrub editing, EQ, waveform redraw, normalization, regions and playlists, fades and gain changes, smoothing, mixing of sound files, sample rate conversion, and time compression/expansion.

In addition to the components described above I also have final beta copies of the Digidesign MasterList software (For putting together a Master List of several songs with timing, blank space, etc. for a CD or tape).

If interested in this system please reply via Email to drichard@execpc.com.

Thanks,

Dean

With nearly all the shells available for MiNT, you shoul better use
text \&lplain file
because otherwise the ampersand would lead to tex being run in the back-
ground and lplain file being interpreted as a new command...

Ciao

It should in theory, since the 68040 is 100% 68030 compatible.

The PMMU in the 68040 has only three different page-sizes, the 68030 has more.
But it should be no problem, because everybody uses 68040 compatible page-sizes.
Pages are used when applying virtual memory, and that`s what LiNUX does.

> the addition of an FPU chip should work as well.

I can now confirm that LiNUX works VERY well on a Falcon with an FPU installed.
It also runs with screenenhancers in resolutions like 800x600, 1024x768 and 1280x960.

: money selling video or sound cards. :^)
: -ken

You're absolutely right, I think. And that's exactly, why I'd love to see (for the first time in Atari-history ;-) some REALLY affordable peripherals and extensions for Atari-models! So affordable that almost anyone could buy ones. With installation-service, if needed.

And now> makers of BARRACUDA accelerator, AFTERBURNER accelerator, gfx cards, diverse Atari towers, etc: lower your prices and increase the availability! Which one is better for everyone: 1) a couple of people have accelerated, top-graphic Falcons, TTs, etc - *OR* 2) almost every Atari user uses a faster, more colourful - better computer?

Cheap 68040 accelerators would be a life-saver for Atari market, I think. So many people here seem to want more power for their otherwise nice computers. So: it's power we want - but where shall we get it ?

I really don't believe that 040 cards are quite as expensive to manufacture, as it seems now. Today they just are targeted as luxury items, for people who have money and need. But in 1995 we _all_ would need 68040/SVGA computers. Here's the market - but where are the people to sell us what PC- and Mac-users already have?

There was _one_ graphics extension that very many ST-users in Europe used: Autoswitch Overscan. It wasn't easy to install, or had very impressive performance. But it was cheap, it worked, and it was what people really needed. It was a big success. We need more of those - because it will benefit us all in the long run.

One idea: would it be possible to construct a cheap, yet powerful 040 accelerator based on German PAK68K boards? Their price/performance ratio is good, and you can even build one yourself from a kit. Something for Falcon..?

Opinions?

: Where can I get it?

You can pick up Latex 2e at any CTAN site. Be warned, the archive is quite large (around 800 K, IIRC, 2 megs uncompressed). It's not difficult to install, at least under CS-TeX. Just run initex (you'll probably need the big version) on install.dtx. It does take a long time. On my T25'ed Mega ST, it took several hours, but it's well worth the wait.

Hasn't this already been done? I mean I have this file sitting in c:/multitos called HSMINT.XDD which claims to be a HSmodem driver for MiNT. Unfortunately the docs are german so I don't know exactly what it does.

And it is still nice today!

Regarding your question: did you compile X yourself, or did you get the
executable somewhere. X not understanding DOS style newlines may be caused by a
particular version of gcc + libraries. At least I have seen several programs,
and also written some programs myself, that had similar problems. It took _me_
hours to find out gcc was to blame in those cases.

Not as expensive as it once was, surely, but the manufacture of ANY custom circuit board or card is a costly proposition. As is so often the case, the cost per board goes down with larger production runs. Manufacturing just a few -is- pricey. Ask anyone that has had custom PCBs made.

What does the Barracuda 040/20 board sell for? US$599 or so? And that won't even fit inside the case of a standard Falcon, right?

> Here's the market - but where are the people to sell us what PC- and
> Mac-users already have?

How big is 'the market' you speak of? How many of those people would buy an accelerator and at what price? And how should the availability of the product be advertised so as to reach the most users? Who should market it? If sold at wholesale, you need to allow for 60%+ discounts to distributors and 40%+ discounts to dealers. Is the potential profit worth the RISK?

>One idea: would it be possible to construct a cheap, yet powerful 040
>accelerator based on German PAK68K boards?

I'm not familiar with the PAK68K board except by name. I'm not a hardware guru either but I do know that the pinouts on the 040 vs 030 are not the same and you have some electronic incompatabilities that must be dealt with thus increasing the cost.

040's generate a lot more heat than a comparable 030. You -should- use use a heat sink and/or cpu-mounted cooling fan. This adds to the cost and complexity of design for the cramped quarters inside the Falcon case.

A final consideration is the cost of the 68040 chip itself. At retail, a 25MHz 040 currently costs ~$200 and a 33MHz costs ~$300 (IIRC). Granted, buying these units at wholesale, in quantity, and/or opting for the 'LC' (non-fpu) versions would save money, but they are still fairly expensive.

Is it possible? Sure. Financially viable? That's another question entirely.

2100. 1040STf's and Networking...

Newsgroup: comp.sys.atari.st
Date: 1995-05-03 00:00:00 UTC
From: allen@icarus.lis.pitt.edu
Message-ID: <3o87t1$7v1@toads.pgh.pa.us>
Source record: 166348

I was recently able to acquire 6 Atari 1040STf's (Plus I already had one to begin with). They are the basic model (1 Meg RAM, 720K floppy, SC1224 Monitor), no hard drive or anything else.

My original system is a 1040Stf, 4 Megs RAM, 2 720K floppies, 1 50 Meg HD (w/ICD host adapter, software v.5.3.1).

What I'm wondering is this -- is it possible to connect these as a LAN? I'd like to be able to set up one as a file server with a big HD and then have the others run off of that. Are there ethernet adapters out there for the ST's?

I'd also like to be able to run SLIP or PPP on them -- is that possible?

Last question -- can anyone recommend a good C or C++ compiler for the ST?

Please respond by email -- not sure that I'll be able to keep up with the newsgroup in the near future.

I have a friend with a falcon, and we have been trying to connect to my STe with Jekyll 1.38. Unfortunately it wont work. I can connect with other ST's without any problem.

Is there a Falconised version anywhere? or, is it a serial port problem with the falcon.

Any tips blah blah blah greatfully accepted 8-)

If I remember the announcement correctly, this ``driver'' just
redirects device accesses to HSMODEM which must also be loaded. (I
didn't bother to look at it because it came without source.)

Query: Doesn't local bus mean something a lot more than "on the processor bus"? If so, my Mac has "local bus video". Does not local bus actually mean LocalBus, a PC bus standard called VLB, VESA-Local-Bus?

> The sound chip was the weakest part of the orignal ST. It had 3 voices, and

Actually, the one in the Apple IIGS was the best out. Full stereo with complete panning, 16 voices fully mixable etc. Quite a powerhouse.

> >ST's interface - compared to the Mac+ it was childish but the ST didn't
> >lock developers into anyone standard way of doing things either.

This, IMHO, is one of the cannards you always hear about the Mac. The Mac is simply a HUGE superset of GEM. I find it much more flexible that GEM ever was for me. For example, the views system in the Finder windows, alias's, drag and drop system modification, direct access to customization (no utils required) etc. If GEM was so good, there wouldn't be a market for 3rd party replacements... when have you seen a 3rd party Mac Finder since Sys7 shipped?

Wonderful! I've been working around this for a year by printing
once with the watermark only, then running the paper through a
second time with the rest of the document... I've read the manuals
numerous times and never found how to do it "right"... Thanks!

Can you overlay multiple graphics the same way? Our homeowner's
association has a graphic and I wanted to drop it into a wreath
for our christmas newsletter but could never get both images to
'show through' - one would always be on top and obliterate the
other one... Does this same fill style/ linestyle combination
work for overlaying graphics?

Hello gang! I've downloaded the MagiCMac demo and I am able to get it running on my Mac but I am TOTALLY lost due to the German used. Has anyone translated this thing to english yet?

Also, I just thought I would try to run good ole BOINK.PRG (the original bouncing ball) so I threw it in the "C" drive folder but when I attempt to run it from the desktop (EASE) it refuses to go. I mean, it won't even load. I double click and it just sits there.

Anyone have any idea what I am doing wrong?

Thanks in advance!

I called Wizztronics today, and they told me that they have more than
1.000 Barracuda-040 orders waiting.. Over 1.000 pre-orders. Quite
impressive, I'd say! So, I wouldn't call this manufacturing just a few,
anymore ;-) ... Somehow it feels like Barracuda 040 is going to be a
succesful product. Let's hope so, at least.

The price just is far too much for many people, including me. But it's
their decision. Maybe the price will eventually go down, so the "rest of
us" can enjoy a faster Falcon.

: > Here's the market - but where are the people to sell us what PC- and

: If sold at wholesale, you need to allow for 60%+ discounts to distributors
: and 40%+ discounts to dealers. Is the potential profit worth the RISK?

There are about 150.000 Falcons around, now (German information). Let's
suppose this is correct. How many of us feel that Falcon *is* a bit too
slow, as it is now? About 100%, I think. Now, how many of us already
own some accelerator? About 10..30%? This leaves us a market of about
100.000 .. 120.000 Falcons in need of more speed. Falcon isn't a cheap
computer. Many of the machines are in professional or serious hobby use.
This means that Falcon-owners (as many people here have told before) do
use much more money to soft- and hardware than ST-owners.

If as few as 10% of us, who want to accelerate our Falcons, really
purchased something like Barracuda - that would mean a market of about
10.000 units. Each $950, or more (with RAM-options, etc.). We speak of
millions of dollars here ! That's something worth considering, I
think...

And as Apex Media's developer recently wrote here, the market itself can
be smallish compared to PC-world - but the market *share* can be very

high. This means lots of sold units, and healthy profits, too.
Especially, because every sold Barracuda makes it more probable that more
and more people purchase C-Lab Falcons - and the market grows. There is
even one pretty exciting possibility:

IF Barracuda-040 proves to be as good as we expect... C-Lab would be wise
to licence it, and this way build a REAL Falcon-040 everybody's waiting
for =-) ! I'd be quite surprised, if somebody isn't thinking about this
right now.

Think about this: Falcon-040 with 8 Mb RAM, 33 MHz, Fast-RAM, built-in
screen enhancer, or (alternatively) a 4 Mb True Color graphics card. Or a
486DX33 emulator. Or... I think I'd LOVE to see C-Lab and Wizztronics
co-operating in near future =-) !!

I also think, that this isn't silly dreaming - but something quite
realistic. And definitely something worth thinking about..

: 040's generate a lot more heat than a comparable 030. You -should- use
: use a heat sink and/or cpu-mounted cooling fan. This adds to the cost
: and complexity of design for the cramped quarters inside the Falcon case.

That's exactly, why C-Lab should build the unit in Falcon-040, and put
the whole beauty inside a nice tower casing with decent PSU.

: A final consideration is the cost of the 68040 chip itself. At retail,
: a 25MHz 040 currently costs ~$200 and a 33MHz costs ~$300 (IIRC). Granted,

: Brian

It IS the same product and the latest version of it. The reason for
calling it Score was so that Steinberg could re-number it v2 in order
to bring it into line with the version numbers of the other platforms.

BTW it also has greatly advanced Scoring features but I don't use them.

>

I've got Geneva on the Falcon...just got it yesterday :) It runs just as fast as single TOS if you're only using one application, or only one that requires CPU attention...I noticed under MTOS that the more programs you have open, the slower each gets no matter what the nature of the program is.

As far as running a few different prgs that require more CPU time, I have not tried. I mostly run (for example), a text editor, term program, and sometimes compile and test programs. For me, Geneva is ideal as the networking stuff is not so important (and it'll support MiNT in the next version anyway)...

If you've got any more specific questions, email me and I'll answer or attempt whatever you're curious about (to a limit ;)

Russ

2118. Wanted:User Groups to Receive Atari-Only Catalogue

Newsgroup: comp.sys.atari.st
Date: 1995-05-04 00:00:00 UTC
From: leslieh@warpcon.ersys.edmonton.ab.ca
Message-ID: <FEEIDGUQUp@warpcon.ersys.edmonton.ab.ca>
Source record: 166116

This is a message to all user groups out there. If you are interested in receiving free catalogues from Computer Direct for atari-only stuff please leave him e-mail at c.krowchuk1@genie.geis.com. Alternately, you may simply reply to my e-mail address, and I will pass along the messages. Please include in your message how many catalogues you would like to receive, address, and any other pertinent information you think is necessary.

Oh, and just in case anyone is gonna feel like solicitation is going on the Usenet, it's not exactly like that. It's simply a way for atari user groups to be made aware of his store more easily. I'm not being paid for this at all, nor am I an employee.

Leslie
(v.p. Edmonton Atari Computer Hobbyists)
P.S. I'm still looking for more (currently only) Canadian atari user groups to begin a newsletter exchange. Email me.

2119. Newsletter Exchange for Canadian User Groups

Newsgroup: comp.sys.atari.st
Date: 1995-05-04 00:00:00 UTC
From: leslieh@warpcon.ersys.edmonton.ab.ca
Message-ID: <FEEIDGUSUp@warpcon.ersys.edmonton.ab.ca>
Source record: 166117
Cross-posted to: comp.sys.atari.st,comp.sys.atari.tech

Due to the fact that the Edmonton Atari Computer Hobbyists are trying to start up a newsletter exchange (even if your user group doesn't currently produce a newsletter) among Canadian Atari user groups, we are trying to make sure that a) all of these groups are still active and b) the mailing addresses are correct. If anyone can shed some light on the status (and/or mailing addresses) of these user groups (some of these groups are obviously still active (like TAF, EACH (of which I am affiliated), and STug), but I wanted to include them just to make sure of the addresses and to keep a list that is relatively complete for those user groups that are not aware of many groups).
Any user groups that I do not receive information about or am given information that they are no longer active will either not be sent newsletters or will be deleted respectively.
If your user group is *NOT* listed, please send me e-mail to leslieh@warpcon.ersys.edmonton.ab.ca, and give me the information. The information will be sent to other user groups unless otherwise specified.
Thank you for your help in creating a more tightly-knit Atari community.

Leslie

ClarisWorks demands a lot less on system resources does it? Does it run on a bog standard original Apple Mac like AtariWorks will on an ST520 Have to support WP at work - the latest version for Windoze is so bug ridden it is a pile of shit.

I have choices : AtariWorks, Papyrus, LaTex. I could continue but frankly I can't be arsed anymore.

There is a german LaTEX 2e package for all Atari's. It's called MultiTEX and distributed by MAXON COMPUTER in Germany. It's one of their "SonderDisk"-packages. It has been upgraded recently with some new Atari-specific features.

>upgrade boards? Thanks.

>Chung Yong

Reply follows: I have installed Xtram (from Marpet) to my STF and it is no problem with actual installation and no problems during my sessions. I recommend it. But there is an omision in the manual. They don't say to make some more space for MMU chip by cutting out aprox. 1/8 inch of metal shield (in units with MMU near the lower edge). But that is minor and mechanical procedure. Again: No problems with Xtram. You basically disconnect those original RAM chips and not to worry about what the pin layout is.

Hi All,

I had a question. I know I can transform my wonderful Falcon into a pseudo-Unix system, but what good will it do me? All I'm really interested in is a kick-butt multitasker, and some Internet www browser (which, I bet, there is none). By looking at MiNT, Minix, Linux, MultiTOS, and whatever else, am I going in the wrong direction? What is Minix? Heck, what is Linux?? For that matter, what the heck _exactly_ is MiNT??? And does any of it have to do with telecommunications?

Yours confusedly,

Ben Allfree

Out of the ether, the following was mentioned by Graham...:

GI> os/2 is almost a bad ..but also as dead in the water as TOS as far as
GI> user base is concerned ..despite a MASSIVE ad campaign and at least a
GI> 6 month lead over the Microsoft offering it is a complete non event
Oh, I wouldn't go that far Graham. I have OS/2, Windows95 and Windows NT loaded on my PC in work and OS/2 tends to be the system I use most, followed by NT (you can forget Windows95 whos multitasking is worse than Mint 0.98!!!! and is about as stable!)

GI> cripples the whole thing and the horrific leakage with even
GI> Microsofts own programs that exists with this resource regularly
GI> brings the system crashing around your precious data.
I've not had any PC's crashing due to the GDI limit. Just cases of PC's with 16 or 32Mb of RAM running out of memory (even though they show the machine to have at least 60% of that memory free!)

GI> TOS,MINTOS,LINUX,0S9,OMEN,MAGIC (okay not strictly an alternative but
GI> as much as Windows is to DOS),MROS,That cartridge port multitasking
GI> system (Can't remember its name now), bound to be loads more I
GI> haven't come across.
Was SMS2 the one on a cartridge you was thinking about?

The one big problem is that none of these systems are ideal IMHO, but then again what would you class as ideal? Windows or System 7 are NOT it!

> ridden it is a pile of shit.

Are you anti-atari or something?? That attitude sure doesn't HELP the "cause" much, fur-sure...

BTW, I don't WANT my software limited to the original 520ST! Like there are user-groups for pre-80x86
machines, but I want my software programmed to make the most use of the 80486 (I'm not stingy enough to
expect Pentium users to be stuck with 80486 stuff, either, if there is Pentium-specific stuff not available on
the 486 chip.. no idea..)
Same with my Falcon.. If, for the most part, programs were written to take advantage of it.. I've no need for
music, true-color, etc...
Like buying a Pentium instead of a 8086 *just* because of the Sound-blaster-AWE and VGA installed in it...
4x faster is nothing compared to the difference you see when upgrading from a typical 8086 to a 386+...

2139. Falcon, SCSI prob...

Newsgroup: comp.sys.atari.st
Date: 1995-05-04 00:00:00 UTC
From: boyd@unicomp.net
Message-ID: <3obmco$aom@ns1.unicomp.net>
Source record: 166137

Please excuse this if I've already asked this in the newsgroup...
Anyone heard of a "loose spring" prob with hooking external SCSI drives up to the Falcon??
Seemed to be a common prob a yr or two ago in the Atari-net Falcon msg-base... But I can't find anyone
with knowledge of it now... Was told, then, that it could be fixed by an authorized-repair-center or
something.. TOAD doesn't seem to know what I'm talking about (they THINK that I don't! <grin>), for sure...
When I hook up an HD, the whole system refuses to boot up. The HD works perfectly on a Mega STE, ST,
etc... The internal IDE works perfectly in the falcon, btw.

Hmm... What about hooking a longer cable up to the IDE interface and using a 3.5"+ (cheaper!) IDE drive
externally?

Thanks for any info!

2142. Re: Ease and NeoDesk (was: Emulator for the mac?)

Newsgroup: comp.sys.atari.st
Date: 1995-05-04 00:00:00 UTC
From: ap055@lafn.org
Message-ID: <1995May4.043549.25929@lafn.org>
Source record: 166140

In a previous article, alfasoldt@aol.com (Al Fasoldt) says:

>> Are Gribnif out there? When will NeoDesk 4 work with MagiCMac?
>
>NeoDesk 4 works with MagiC on my TT.
>
>Al Fasoldt, Systems Editor, Syracuse Newspapers
>
How did you get it to work? The docs that come with MagiC are as thin as the one that came with NVDI. I tried putting neoload.prg in the shell line, but it didn't work. Also, Magic likes to set my color monitor to 50 Hz, and I can't think of a way within MagiC to set it back to 60 Hz.

MagiC is fast, but the documentation is really sparse and it is a little rough around the edges when it comes to convenience. Do the flags you set (like running single tasking mode) in Magic.inf work when you run it with NeoDesk instead of its built in Desktop?

2143. Help needed! F030 + Quantum E1080 SCSI

Newsgroup: comp.sys.atari.st
Date: 1995-05-04 00:00:00 UTC
From: Szymon Stasik <stasik@bull.mimuw.edu.pl>
Message-ID: <Pine.BUL.3.90.950504093235.19780A-100000@bull.mimuw.edu.pl>
Source record: 166276
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have got SCSI HD Quantum Empire E1080S - 1GB an when I was installing
it, I move autobooting with connected IDE drive. Now I sold my old IDE
and I have a lot of data on SCSI drive, but it doesn't want to autoboot! :((
It's installed with ICD (no AHDI compatibility) and option Boot for
selection of boot partition works but doesn't make any effects.

PLEASE HELP ! (It isn't funny to boot F030 from FDD :(((

Simon. :((((

2144. MiNTnet & Geneva?

Newsgroup: comp.sys.atari.st
Date: 1995-05-04 00:00:00 UTC
From: DOMINGO@news.delphi.com
Message-ID: <3oa1p0$ipq@news2.delphi.com>
Source record: 166277
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I already have Geneva. Should I get MiNTnet? What else do I need to set up an Internet connection?

I am new at this (SLIP/PPP/etc.), but not new to computing/telecomputing. Are the available Lynx and Chimera programs GEM based or .TOS based?

Please point me in the right direction on how to do this and where to get everything. I.e. what files at umich, etc.

Thanks in advance!

Dom

P.S. Since most people feel that AES4.0/MultiTOS is so slow, I figure Geneva/MiNTnet should be pretty speedy.

'cuse me - Are you refering to MagiC as being an alternative like
Windows is for DOS ??

MagiC is a TOS REPLACEMENT! A new TOS/MultiTOS compatible operating system.

MagiC is real pre-emptive multitasking, which is VERY fast and effective!

Actually MagiC 3 runs a normal GEM-application about 20 % faster than normal
single TOS.

By the way I've just got a patch that makes the current MagiC 3 version work
on a Falcon.

Keep Cool and Flying...

BEWARE OF Q TEK/Q LOGIC UK!!!
Let me tell you something...

On 7th September, 1994 my friend ordered an MM1 FRIENDCHIP MIDI MULTIPORT FOR ATARI FALCON, and payed immediately through his Credit Card . 229. He waited weeks an weeks hoping to have what he had bought. Everytime he phoned or faxed Q TEK/Q LOGIC found silly explanations for that delay. At the beginning of this year they refuse to answer to my friend's faxes and messages he left on their answering machine : now he can with no doubt say HE's BEEN ROBBED!!.

Don't buy everything at Q TEK/Q LOGIC UK!!!!
(99 Douglas Street DUNDEE UK)
IF YOU DON'T WANT TO MAKE THE SAME EXPERIENCE!!!

I you have about similar situations, please replay to this e-mail.

>I see that I would want to use is Cubase Score, but is Score the same as their
>standard top of the line sequencer? I thought it was just called Cubase!
>Does Score simply add notation to the regular sequencing package?

"Cubase Lite" (replaced by Cubasis soon) is the 16 track beginners version.
"Cubase 3.1" is the normal full sequencer version (128 tracks + all modules).
"Cubase Score 2" is 3.1 + professional notation and some new selection menu's.
"Cubase Audio CBX-D5" is Cubase 3.0 + audio part which needs Yamaha CBX-D5.
"Cubase Audio Falcon" is Cubase Score 2.0 + audio part with effects (needs a
Falcon and a SCSI drive).

Furthermore, you can buy Studio Module (sound librarian/manager), Cue Trax
module (graphic tempo editing and calculating) and Style Trax -module
(Band-in-a-Box style extension) for any Cubase starting from 3.1.

If you get the normal version, you can upgrade to any version later.

Every so often used to have the same error come up. I use Kobold
(a must have) but I think that the Falcon is VERY pickey about
being terminated properly (the SCSI buss that is). If you haven't
checked you drive(s), be sure that only the last one is terminated
(I know, very basic) and that you use an external terminator on
your hard drive case. Avoid Maxtor drives, use the custom driver
that comes with Outside Virtual Memory Manager and Extendos Pro
for your CD (if you have one). I have 2 Quantum 540 LPS's,
a Segate Hawk and a Plextor 4X and haven't had any problems for
a while. One more thing, be sure all the drives supply the
proper termination power to the Falcon SCSI buss. The Falcon
does supply voltage to the first drive however and that one
can be left off.

:)

Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other.systems,misc.forsale.misc

Having just bought a nice TT030, I am now able to offer the following
forsale:

1 Mega STE 4/0 (16mHz 68000, TOS 2.06, 1.44 Floppy) + keyboard
1 Atari SC1224 Color Monitor
1 IBM Case with Power Supply
1 ICD AdSCSI (+?) Host Adaptor ---------
1 OMTI RLL Controller |
1 OMTI MFM Controller | -- All in IBM case
1 40 Meg RLL drive |
1 20 Meg MFM drive (40M RLL) ---------

$600 for everything + 1/2 shipping. I will split the system if interests are
high enough. The hard drives have a mostly complete and working MiNT (1.12h2)
installation on them.

Also for sale since I don't use this anymore:

Spectre GCR 3.0
All original software included
All Mac disks I have
PRICE: $150, shipping included

> I called Wizztronics today, and they told me that they have more than
> 1.000 Barracuda-040 orders waiting.

Really? Does that mean that over 1,000 people have put a cash deposit down on a US$600 - $1000 accelerator board that is yet to ship (AFAIK)? Hard to believe that many Atarians are so flush with cash. Rather depressing since I'm not presently in that, er, situation. :)

> There are about 150.000 Falcons around, now (German information).

As I've stated before, I think the German computer press has greatly exaggerated these sales estimates we hear from time to time. Personally, I think 1/3 that number is closer to reality but that's just IMHO so one man's guess is as good as any other. It doesn't really matter.

> If as few as 10% of us, who want to accelerate our Falcons, really
> purchased something like Barracuda - that would mean a market of about
> 10.000 units.

Sorry, but I think your logic breaks down here. A 10% market share for ANY computer product defines phenomenal (Microsoft-like) success! For commercial software, sales to 3% of the market would generally be considered very good. For hardware add-ons, particularly such expensive goodies as this, projected sales figures for a successful product are usually much less.

Granted, the Atari market is not typical (far from it!) but I doubt that 10% of the 'available' Falcon market is willing to fork out well over US$1,000 (add up the cost of the Barracuda board, the 040 cpu and a case for it all to fit in not counting any fast-RAM memory options).

Don't get me wrong. A fast 040 Falcon would be wonderful and I praise Wizztronics for the effort and wish them fabulous success. But there is NO way I'm going to pay that kind of money to get one. A lot of Falconers will lust after this product but how many will actually BUY one in the end? Professional graphics artists and the like, sure, but I predict few everyday users will be able, or willing, to fork over a grand for this.

I think Wizztronics will do -very- well to sell 1,000 units in total. If they do, then maybe they'll have the margins to design an -internal- board at a much lower (<$500) installed cost. Now THAT would be great!

>connected to the same leg on the 6850 which sits at the opposite side of the
>board to that suggested by the instructions. If in doubt, talk to Tony
>at the Windsor office or email ssolutions@cix.compulink.co.uk.

We got it in to a stage, where the CPX changed the LED (on-on/off-off, grey
wire was connected to the right hand side 6850), but Benchmarks were *exactly*
same no matter what the LED said. We also put the gray wire to +5 elsewhere
(Ssolutions told us it's getting +5 via grey wire), so the LED was lit
continuosly, but no speed difference was measured then either.

Do you think I should open the case again and install it again to the
other 6850, after all this testing?

I was just going to send it back for replacement.

From: komb1@wink.io.org
Message-ID: <3obrde$6ro@ionews.io.org>
Source record: 166142

One step forward 2 steps back!

After locating the Linux 68K Faqs I noticed I was trying to install Linux .01Pl2. So I thought I'd do everyone a favour(sp?) and get the latest .09Pl6 and Bootstrap 5. However, this has turned out worse for me than when I started!

Bootstrap 5 Dosen't seem to work on my TT! Or atlease NOT while I'm in MiNT.

When I boot From Multitos (with X-control & mouse acc) the screen goes to bands of multi colour and freezes. (Without the ACCs it JUST freezes) I tried once in TOS and actually got to see some of the Boot 5 screen, but even that was only 1/2 finished before everything came to a compleate hault.

Any help or suggestions? (Other than go back to .01Pl2?) ;-)

Message-ID: <3obvd5$pim@jhunix1.hcf.jhu.edu>
Source record: 166144

I understand that the Speedo font set has a number of extended characters beyond the standard ascii set. Yet AtariWorks can't even seem to access all of the standard atari characters. How can I type foreign characters using Atari Works? Specifically, I need umlauts and an ess-tset. It would also be nice if I could print other things like the 'smiley face' and things that are part of the Speedo font set. Is there some trick I'm missing? This seems to be a very vital part of the program. How, for example, would a German user use Atari Works? Thanks for your help!

-Devin

2173. Linux Questions

Newsgroup: comp.sys.atari.st
Date: 1995-05-05 00:00:00 UTC
From: troyc@bnr.ca
Message-ID: <3oc5bg$gvg@batph8.bnr.ca>
Source record: 166146

Hello all.

I recently installed Linux on my TT030. I now have a few questions to
your Linux gurus.

1. Where are the Serial/Modem devices. There is one called /dev/ttyS0,
it does not seem to be a serial port as it is for the amiga. Without
a modem port, I cannot call out with xc! I have to use a TOS terminal
program (like I am doing now!)

2. Swap partitions. I have created a swap partition on my Seagate 157N.
This is connected to my SCSI port after my internal Quantum 120. I
have the Quantum setup with TOS partition 1, EXE2 partition 2.
The Seagate has Minix partition 1, and EXE2 Swap partition 2.
Everything works fine as far a Linux goes, but when AHDI tries to
boot the drives on powerup, I get 2 bombs after the Seagate is detected.
I have two choices at this point...use an ICD driver to bring the
Seagate up, or leave it unplugged from the system until I bootstrap
and then Linux detects it with no problem. I suspect this has
something to do with the partition sector (0), because the drive boots
fine when it is an exe2 partition. It is only when I run mkswap and
then reboot that the problem occurs.

I would rather get the drive to work with TOS, since partition 1 is
my MiNT partition.

3. Is there any way to format a drive without using the ICD formatter?
I don't see any way with AHDI to format a drive, unless I am missing
part of the distribution.

Thanks for your help

Calling all Atari owners that might have unused ST computers in good working shape or in need of repair. Have a couple already (prepping one to give to kids), but would like to cannibalize some non-working units for parts, including TOS (all versions), MMUs, RAM, power supply, floppy drive, etc., and try my hand at modest basic upgrades. Drop me a line if you've got something you've given up on, but might have some salvage value for a tinkerer. Thanks for listening. DF

If I buy a 68882 maths co processor for my falcon, will I still be able to use it when I get my 32mHz upgrade board? i.e. will I need a faster 68882?

Any help would be great, as I intend to get Linux up and running on my falcon a quite a good speed.

Cheers, Simon.

Hello Lance,

| After locating the Linux 68K Faqs I noticed I was trying to install Linux
| .01Pl2. So I thought I'd do everyone a favour(sp?) and get the latest .09Pl6

this seems very strange to me, because there is no Pl6 out yet. I assume you
meant PL5?

| Bootstrap 5 Dosen't seem to work on my TT! Or atlease NOT while I'm in MiNT.
|
| When I boot From Multitos (with X-control & mouse acc) the screen goes to
| bands of multi colour and freezes. (Without the ACCs it JUST freezes) I
| tried once in TOS and actually got to see some of the Boot 5 screen, but
| even that was only 1/2 finished before everything came to a compleate hault.

Where did you get the kernel from? If it is from tsx-11, then it doesn't work.
No kernels from tsx-11 work, sadly. There are some ftp-servers here in Germany
which provide running kernels, such as
ftp.rz.tu-harburg.de pub/ATARI/unix/linux
ftp.phil.uni-sb.de pub/atari/linux
Try and have a look there, if possible.

If it doesn't run then either, you should describe your hardware a little bit
more complete. :-)

Greetings,
Thomas

2186. Re: Linux Questions

Newsgroup: comp.sys.atari.st
Date: 1995-05-05 00:00:00 UTC
From: setl2509@tuhhco.rz.tu-harburg.de
Message-ID: <3octkg$c5g@rzsun02.rrz.uni-hamburg.de>
Source record: 166159

Hi Troy,

| 1. Where are the Serial/Modem devices. There is one called /dev/ttyS0,
| it does not seem to be a serial port as it is for the amiga. Without
| a modem port, I cannot call out with xc! I have to use a TOS terminal
| program (like I am doing now!)

Why do you think that /dev/ttyS0 is amiga-only? The serial ports are numbered
ttyS0, ttyS1,... You can create them by using the MAKEDEV script in /dev.

But, there is no driver for the SCC chip so far, that means you can't use
the modem2/serial2 ports. Only modem1/serial1 is available, but they work
fine.

| 2. Swap partitions. I have created a swap partition on my Seagate 157N.
| This is connected to my SCSI port after my internal Quantum 120. I
| have the Quantum setup with TOS partition 1, EXE2 partition 2.
| The Seagate has Minix partition 1, and EXE2 Swap partition 2.
| Everything works fine as far a Linux goes, but when AHDI tries to
| boot the drives on powerup, I get 2 bombs after the Seagate is detected.
| I have two choices at this point...use an ICD driver to bring the
| Seagate up, or leave it unplugged from the system until I bootstrap
| and then Linux detects it with no problem. I suspect this has
| something to do with the partition sector (0), because the drive boots
| fine when it is an exe2 partition. It is only when I run mkswap and
| then reboot that the problem occurs.
|
| I would rather get the drive to work with TOS, since partition 1 is
| my MiNT partition.

Hm. Seems to be a problem with AHDI. But why not use the ICD driver, it's
much better than AHDI, AFAIK.

| 3. Is there any way to format a drive without using the ICD formatter?
| I don't see any way with AHDI to format a drive, unless I am missing
| part of the distribution.

Sorry, I don't know. But I don't see much chances...

Greetings,
Thomas

From: jperez@uhunix3.uhcc.Hawaii.Edu
Message-ID: <D837zt.Jv0@news.hawaii.edu>
Source record: 166161

In a couple of recent posts, I had noticed that Epic (from Ocean software) was supposed to be Falcon compatible. There was even mention that it can use the 68882. I purchase Epic, and cannot (by any means) get it to work.
Either it crashes after loading the soundtrack (before playing any music) or it crashes after the Red Alert screen (although the "Red Alert" voice is not heard). I have tried Backwards 2.72, Fboot, and a variety of different NVRAM settings.
Has anyone been able to get Epic working on a Falcon?

I can confirm, that my Falcon also runs fine with 19.200+ baud.
Right now I have my Falcon hooked up on the network at Aalborg University via
a 38.400 Baud serial plug in the wall - works great.
The Falcon can handle up to 115kBaud DTE speed, CoNNECT V.2.44 supports it.

From: troyc@bnr.ca
Message-ID: <3ocbre$jsn@batph8.bnr.ca>
Source record: 166205

Now I have new problems with my AHDI driver. I somehow have killed the autoboot on my C partition. I now have to load the thing from an auto folder.

I have version 6.05c, but I only have the driver shdriver.sys! I don't know of any other related files on my hard drive.

How do I get my drive to autoboot (bootload is what the program calls it) again? I have tried rewriting the partition info with the boot flag set, but that does not do anything.

Please help! This is anoying to have to boot from floppy!

Thanks

|> the I/O only (screen, keyboard, etc..)/.

Quite a nice idea really, as the cost of low end PC's these days is mostly
for the IO resources, the processor card is peanuts.

|> The GEMulator on the IBM emulates the ST in software.. that is, the IBM
|> computer has to run the 68000 code by converting it all to 80x86 code
|> before execution.

Hmmm. I think your wrong here. There is a Mac emulator for the PC that
works this way, and PC emulators for the ST (PC Ditto 1), Mac (SoftPC)
and TT/Falcon (SoftPC as well).

|> If you were to use the same trick as the PCSpeed did, ie: put an ST into
|> your IBM (as indeed another ST emulator product does), the speed would be
|> far greater.

I thought that the GEMulator card did the same as the Janus card - ie.
it had an on-board 68000 (the Janus has a 16MHz 68000 on the card).

|> In other words, it's not the superiority of the hardware or architecture
|> that makes emulation on the ST faster, it's the type of emulation being
|> used.

Yeah, but you can do that sort of emulation of the Atari to - SoftPC is
just about useable on a f030 4/32Mhz.

Craig.

2198. Installing MiNT and X windows

Newsgroup: comp.sys.atari.st
Date: 1995-05-05 00:00:00 UTC
From: grantr@cs.man.ac.uk
Message-ID: <3ocui7$70f@m1.cs.man.ac.uk>
Source record: 166210

This is a bit of a newbie question, you've probably answered this hundreds of times, sorry.

I've tried installing MiNT on my 4mb STE a couple of times, with some success, but it never
really all fits together. There are always bits missing. The Minix file system always behaves
strangely. Lots of envoiroment variables to set. It's all very daunting! Now, I find that you
can stick X Windows on top of the lot. More installing!
The actual problem is that there are so many files scattered around on ftp sites and so much
information to collect before you can start creating your unix style system that the whole
task becomes unimaginable. Has some brave soul out there done everything and remebered how?

Is there a faq somewhere that takes you through step by step creating the system?
Or can someone point me in the right direction for some good documentation on how to create my
own custom setup?

Would reading a book on UNIX be any help?

Help needed before I go insane again. For example, when I find out I've set up something critical completely wrong
or forgotten the file xyz.zoo on ftp site whoknows.universe.edu.

Any help would be welcome with open arms and a big big thankyou.

Cheers, Robin Grant.

grantr@cs.man.ac.uk
grantr@vnet.ibm.com

ps the Mint install disks you can get never seem to work correctly (or is it just me?)

2199. NeoN News

Newsgroup: comp.sys.atari.st
Date: 1995-05-05 00:00:00 UTC
From: halten@134.96.68.11
Message-ID: <3od17c$hfb@coli-gate.coli.uni-sb.de>
Source record: 166211

Hello !
I've got some NeoN-news from TEAM Computer, Germany.
NeoN - the professional renderer /raytracer and 3D animation
prg - for the ATARI falcon030 is now available for ATARI TT
and MagiC-Apples. These special versions include all features
of the falcon's version. The input/output formats are on every
computer system the same. So you can design on a falcon and render
on a Mac. The rendering speed and animation capabilities on TT or
Mac are very fast (vast!).
There is a new export function in the new beta-version of Arabesque II.
You are now able to convert vector-fonts and graphics into NeoN's .SHP
format. So you can use every font for 3D animation.
is available in june.
Till then, have fun using NeoN to create your own 3D world...

Yours,

Christian Halten

2200. Setting up MiNT and X Windows

Newsgroup: comp.sys.atari.st
Date: 1995-05-05 00:00:00 UTC
From: grantr@cs.man.ac.uk
Message-ID: <3od8n9$bu7@m1.cs.man.ac.uk>
Source record: 166212

Okay, this is a completely newbie question that's probably been asked hundreds of times.
Sorry in advance.

I have tried many times in many ways to set up a unix style system on my Mega STE but to no avail.
There are hundreds of small programs to get hold of, a directory structure to sort out, a new Minix file
system to setup, envoirment variables to set (what ones and where, who knows?).
The main problem is that the documentation is sparse (or am I looking in the wrong place?) and all the
files are scattered all over the world in ftp sites. To tell you the truth it's hard to know where to
start.

So before I go insane over realising if forgot xyz.zoo from ftp.universe.nowhere half way through a lengthy
installation can some one please point me in the right direction.

A step by step guide on how to set it up on the atari would be absolutely perfect. It could give locations
of files at ftp sites, where they go on the atari and at what time they should be installed.

Even a small faq on generally how it all works would be nice.
Would reading a small book on UNIX be any help in understanding all the daunting lingo?

It is a shame really. There is alot of good atari software out there to be used but I think alot of people
never get to use it due to the fact it's so hard to set up and so little help to do it (or is it just me?)

Somebody out there must know how to do it all. I've read so many postings that knowledgeable people in the
subject have written. Any help would be welcome with wide open arms and a huge thankyou.

Cheers , Robin Grant

: I just got a 68882 FPU (math coprocessor) put in my Mega STE. Now
: what? What software is out there that makes use ofthis troublesome
: little chip?

I must admit to being a little surprised at the number of applications that *don't* use the FPU. I have been programming PCs for 10 years (only at work!) in Turbo C. This, in its default state, will compile code which looks for a FPU, and uses it if it is there. Therefore all the code I wrote benefitted when it was ported to a 486 based machine, even though it didn't do much maths. Every time you declare a "float" or "double" and do maths with it, the FPU gets used.

I use Lattice C 5.5 on my Falcon, and it has an option to do the same thing. Lattice C has been around for a long time, and I assume it is used by lots of Atari developers, which makes me wonder why they didn't have this switch enabled ? Is this a new feature of Lattice C ?

I' having problems persuading AV_PROTOCOL drag & drag to work under MultiTOS/
AES4.1. I have the AVSERVER enviroment variable set up from GEM.CNF
as
setenv AVSERVER=THING
but I still cann't drag & drop onto AV compilant accessories (ones which
I know work under single tasking TOS). What is the problem? Are the accerories
not paying attention to the AVSERVER variable (I know this is the problem with
Edith, as the author has already admitted to never hearing about the
AVSERVER variable) ?

Gemini has the same problem - so whats the solution?

Craig.

Maury Markowitz (maury@softarc.com) wrote:

: This, IMHO, is one of the cannards you always hear about the Mac. The
: Mac is simply a HUGE superset of GEM. I find it much more flexible that
: GEM ever was for me. For example, the views system in the Finder windows,
: alias's, drag and drop system modification, direct access to customization
: (no utils required) etc. If GEM was so good, there wouldn't be a market
: for 3rd party replacements... when have you seen a 3rd party Mac Finder
: since Sys7 shipped?

GEM is much nicer to use, IMHO. MacOS is fine in many ways, but it isn't perfect - in fact, far from it... The way it still throws the icons inside desktop windows to all the most peculiar places, sometimes makes me beg for mercy... The fileselector is (again IMHO) inferior compared to Selectric, or Universal Item Selector 3. Some people like those pull-down menus. I don't: I prefer GEM's drop-down system. MacOS doesn't understand anything but plain 100% standard DOS floppies. Try to format them with Fastcopy as 1.44 Mb, and you'll see what I mean.. Mac locks up completely, trying to read the disk. And the same disk works perfectly on any PC.. Wanna use 820kb or 1.7 Mb floppies with Mac? Hasta la vista, amigo... System error. I wouldn't call that very flexible!

There are lots of examples like these - but let's save ourselves from them. It's simply *no use* comparing two different operating systems and graphical environments. One may have a better file selector, another something else. But neither is superior to another. And nothing's perfect.

Greetings,
TH

2209. More Linux Partition Info

Newsgroup: comp.sys.atari.st
Date: 1995-05-05 00:00:00 UTC
From: troyc@bnr.ca
Message-ID: <3odhqb$6li@batph8.bnr.ca>
Source record: 166221

I got this info from Benni's Linux Archive. I still have questions after,
so don't stop reading quite yet!

------SNIP-----------
> BTW, I'm going by the assumption that I change the partition id to
> something other than GEM or BGM _first_, and then create the swap
> space on that partition using mkswap under Linux/68k.

Correct. The problem is that mkswap changes sector 0 of the swappartition,
which is the bootsector on TOS's FAT-filesystems. A clever harddisk driver,
like HDDriver, will notice that the bootsector contains invalid data and
subsequently report an error when Gemdos asks for the boot-parameterblock.
AHDI and some other drivers simply pass the invalid data to Gemdos, which
gets very upset about things like a 65535 bytes sectorsize and crashes.

There's one more thing you should know about AHDI: when it finds a
secondary partition (ie. a partition whose descriptor is not in the
real rootsector, but in some auxilary rootsector) with an ID different
from GEM or BGM, it will stop searching for any other partitions.

Example:
entries in sector 0:
1. BGM <- recognized and used (BIOS device C)
2. LNX <- recognized, but not used
3. BGM <- recognized and used (BIOS device D)
4. XGM (points to aux. rootsector A)
entries in sector A:
1. SWP <- recognized, but not used
2. XGM (points to aux. rootsector B)
entries in sector B:
1. BGM <- NOT recognized by AHDI
2. <invalid>

Most third party drivers won't show this bug, they will recognize and
use (as BIOS device E) the final BGM partition.

Waldi
-----------SNIP--------------

OK. So this being the case, that mkswap messes with the boot partition
(I suspected this all along), how do I keep my AHDI from freaking out???
Right now I get 2 bombs when AHDI gets to that partition. Will changing
the partition id to SWP take care of the problem? Will AHDI ignore the
partition with a SWP identfier? (of course I asks these now hoping to
get some confirmation before tonight, but tonight I will go and try this
and know the answer anyway!)

Thanks.

Oh...I also found the answer to the serial problems there too. Should
have checked the DOC directory before asking these questions.

That does not make it local bus, that makes it "on the bus". The two are completely unrelated.

> : The sound chip was one of the things I hated the most about my ST. The
> : C64's SID chip was at least as powerful.
>
> Still, it was much more than what you got from a bare-bone PC or a Mac!

Maybe from a PC, but not a Mac. The Mac was and always has been polyphonic, with upgradable synths. Even a loagy Mac + does a lot more sound than my ST ever did.

German Pure Pascal is excellent (I don't know, if they've bothered to translate the thing in English..). It's simply great. And fully PC Turbo Pascal 6 -compatible. It's fast, produces good code, and easy to use. And even better: you can get a Visual Basic -like (in a way..) extension called "Application Construction Set", or ACS Pro. That makes it easy to create great GEM-programs graphically, in a modular way. There's even a Pure Profiler available for their Pascal and C-compilers.

Maybe someone can give the address where this thing is sold?

Cheers,
TH

Btw, the German language doesn't make it impossible to use at all, if you know something about Pascal already. For a beginner, it may cause headache..

Ofir Gal (ogal@cix.compulink.co.uk) wrote:
: >There are about 150.000 Falcons around, now (German information). Let's

: Divide by 10...

Is that fact or fiction? Subjectively, there seems to be lots of these birds flying in Europe. In Finland, I myself know more Falcon-owners than ST/STE-owners. And this doesn't mean I know 2 Falconists (including me, of course ;-) and one STE-owner... No. There are surprisingly many Falcons around, despite the sad fact that Finland has never been a good Atari-area. Considering that there are about 2.5 million ST-models sold around the world, I wouldn't say 150.000 Falcons is at all impossible. The German market alone, with their 2.000.000 ST/TTs could easily sell that many Falcons.

Remember, ST/STE is yesterday. TT too, even if a nice computer. Falcon (don't say it's yesterday too - because almost every computer becomes that very quickly ;-) is today, and even tomorrow for many ST/STE-owners. The only alternative, actually, for many of us. I find is perfectly logical that 150.000 ST/STE-owners have upgraded their system, instead of waiting for some new Super-Atari, or even doing something desperate ;-)..

If Atari doesn't give any official numbers out, all we can do is guess. I also wonder, why would C-Lab bother to buy a computer that sold only 15.000 units in 3 years..? It wouldn't make much sense. They *must* believe there is a market for C-Lab Falcons; a profitable market.

I sincerely hope you're not right, but if you are... Then I'm pretty amazed. Practically all the Atari-owners I know have upgraded to Falcon in Finland - and most of them are not even musicians. Could it be so that this hasn't happened anywhere else? In Germany? In Great Britain? Is it so, that everywhere else (but Finland) Atari-owners have thought: "Falcon's not worth buying" - and either purchased a Mac/PC, or kept on using their 16-bit systems..? Very strange.

In that case, I must say I really don't understand the majority of us.. We seem to have very different ideas of what makes a computer good ("we" means all us ex- or present Atari users). It's easier to be a PC- or a Mac-owner, it seems. Everybody tells them: "you really have a GREAT computer (even if you don't know it), with the greatest applications in the world..". And it's easy to believe 10.000 PC-magazines =-) Even, if they years ago claimed that "Windows 3 is great.." ;-)

We are abused, poor losers, it sometimes feels after reading messages here. No decent programs. No support. No decent hardware. Or could it be, that we're a *lot* more critical computer users than those

100.000.000 Windows-users..? I think, we sometimes are.

No matter, how small and miserable we are - I still feel that we've been smarter with our choice than most people. We use what we want to. They use what they're given - that makes a difference. It's just pity to see that those 100.000.000 DOSeased feel they're the winners. Perhaps some day they'll wake up knowing the awful truth 8-) ! And what a painful day that will be for them...

Try ICD host adapter. I have two of them and find that they work very
well. You can get the kit you need to install in your box for about
US$180. It comes with the software you need, you can also get thier
PRO level software to repair bad files.

You can also get the ICD link which looks like a small adapter, about
the size of the SCSI connecter.

J> Alternatively, where is the cheapest place to buy them from (in the UK)?

ICD Europe GmbH
Am Goldberg 9
6056 Heusenstamm
West Germany

G> eliminate this>>problem?

G> Actually, I ripped out the RF converter from my Mega. It helped a bit, but
G> there is still some noise even without the RF converter...

Your problem is sheilding, you need to sheild your equpment from
electro-magnetic fields. The best way to do this is to sheild the
source of the fields (your computer and/or monitor). That's why the
inside of your computer is enclosed in a metal cage (electro-magnetic shield).
If you've removed this shield then you must put it back.

Monitors are poorly sheilded and if you put two ST monitor close together
you'll see the screen change or get "show". If you can find a box or
simular made of magnetic material (steel box), you can put it over the
monitor for shielding.

I had a Mono and a Colour monitor sitting beside each other and got "show"
on the Mono monitor. I then took my wife's steel baking pan (had to do
alot of ass kissing) and place it vertically between both monitors.
I worked very well, until she decided to do some baking.

>What is the last possible date your computer / operating system allows?

I think the dosdate goes until 2107 (= 1980 + 128). An over-enthusiastic
beta tester once reported a bug that papyrus did not handle dates beyond
2044 correctly due to a sign mistake.Customers who run into this
problem can get a free update then :-)

But that's an interesting thought. I bet there is a lot of older software
out there that does something like printf("19%d", year), so in about five
years we'll see many computer-written letters dated 1900 and software houses
selling an extraordinary number of updates.

My UPOINT light version definetely states it's PD (look at the info box at
startup)

Only the medium version has te be bought and registered.

On my TT the loader program ATABOOT.TTP runs fine from MultiTOS and
straight TOS. It should not care about from where it is run as it takes
over the complete computer, nothing of TOS, Mint, MultiTOS is used by
Linux.

On your Falcon try and boot up from a monochrome resolution, like ST high
or so, and see if the screen gives readable output.

BTW I'm running a self-compiled Linux 0.9.5 kernel.....

>> say, "Netscape" or "Mosaic" via UNIX which my host server (hopefully) has
>> installed?.. Or am I getting this all wrong?

There has been talk by some people of writing one for "plain"
TOS. But I don't think anything has happened. Really the effort should
be put behind making GEM interfaced programs for MiNTNET (imho). MintNet
is actually getting well into the range of being of use by the non guru.
Stick a nice interface like the mac or pc has onto some of those programs
and we'd be on the highway.

Just my thoughts,

Dan Ackerman
aka baldrick@terminator.rs.itd.umich.edu
```

>inside desktop windows to all the most peculiar places, sometimes makes
>me beg for mercy...

It doesn't put the icons in peculiar places, it puts the icons where the user places them. If you want the icons arranged neatly, then you can arrange them in whatever way you want. The Mac will also snap them to an invisible grid if you want.

>The fileselector is (again IMHO) inferior compared to
>Selectric, or Universal Item Selector 3.

I've always despised those replacement file selectors for the ST. In my opinion, the Atari file selector in TOS 1.4 and later was just fine, because it did exactly what it was suppposed to do: allow the user to select files.

Adding all those buttons to delete files, rename files, create folders, and so on simply clutters up the interface. After TOS 1.4, I don't think most people had problems with the file selector because it wasn't good for selecting files -- once the problems with the old (TOS 1.0/1.2) version had been fixed, it did its job just fine. People wanted file management from within their applications, and they used those weird replacement file selectors to get it. Atari could have addressed this by providing either a simple desk accessory to provide simple file management, or by providing a multitasking operating system.

The Mac File selector does just what it's meant to do, and it does a good job -- it allows the user to select files. If you want to do file management, then you can switch to the Finder for file management.

In my opinion, a file selector box is NOT the proper place for file management, on either the Mac or the Atari.

>Some people like those
>pull-down menus. I don't: I prefer GEM's drop-down system.

Just as there are (or were, I don't know if they are still around) utilities to make the Atari's menus pull-down, there are utilities to make the Mac's menus drop-down.

There was no stereo capability built into the sound chip (I have the data
sheets and the data manual), which was the General Instruments AY-3-8910
(it might have been the 8912, which had one 8-bit general I/O port instead of
two, like the 8910, but I'm too lazy to check). Any stereo capabilities the
Tweety Board added were provided by simply routing the analogue output pins
of the 8910 to different speakers. Any stereo effects would have had to be
provided totally in software.

>You're right that Atari did make a mistake in not publishing established
>interface guidelines for GEM. However, I think they also wanted to
>have programs appear as fast as possible for the ST - as GEM documentation
>was always sparse, this lack of a standard only helped get things released.

I think the fact that a great deal of software was released quickly after the
ST was introduced had more to do with the fact that Atari provided the
relatively-inexpensive developer kits to literally anyone who asked. The
documentation for TOS still stinks (I have the developer's kit!)
The problem was that although the ST had a great deal of software at the
beginning of its life, it did not have a great deal of *high-quality* software.
It wasn't until quite a while after the ST was introduced that we started
seeing software which really tried to take advantage of GEM. Even then, each
program did its own things. There were no human interface guidelines from
Atari, and the few general rules that were mentioned in passing in the GEM
documentation were never adhered to.

>You're also correct in the ST's screen display being slow but that was only
>under GEM - as I'm sure you'll recall much of GEM was written in C and many
>parts of TOS were far from optimized. When programmers began to learn to
>write directly to the screen, things really screamed (remember TEMPUS?).

And that's why so much software kept failing when new machines and new versions
of TOS came out. Once the ST was released, Atari should have optimised TOS.
They didn't. It wasn't until TOS 1.4 in 1989, that we saw an improvement in
the VDI's speed. By that time, the ST was already dying.

Writing to the screen and accessing hardware directly is NOT a good thing.

>of acqiring future technolgy. Apparently, the Tramiels were blind to this

Just a correction: I looked it up, and the chip the original ST used was the
Yamaha YM-2149, a clone of the General Instruments AY-3-8910, the model with
the two 8-bit I/O ports. The two 8-bit I/O ports were used for control and
transfer of data to/from the Centronics parallel port.

I have found that AHDI is fussy about installation, sometimes it is easier to
re-format the drive & re-install AHDI,backup the drive first, of course :) .

Do you have all of the AHDI utilities needed?

Atarians past, present and [:)] future:
I realize that I'm about five years late (or more), but I recently picked up somebody's unused Zubair Z-RAM 3-D/4MEG upgrade kit for my old Atari 520STFm. Came with 2MB of RAM seated on the board, would like to add 2MB more to get full use of its capacity. Have some questions for anyone who has done the upgrade and knows what they're doing (or did):

1) Board was populated with Samsung(?) RAM chips (KM41C1000P-10). In obtaining extra RAM, do I need to get EXACTLY the same type of chips to fill the rest of the board, or are others OK as long as I match the speed of the existing ones? Do I need to know anything about the limitations of the ST with regard to faster RAM chips? Can anyone direct me to distributors that carry these chips for a decent price?

2) My unit has the original TOS 1.0. When I get around to upgrading this, are any more recent versions of TOS incompatible with the Z-RAM upgrade?

3) MMU is older CO25912-38, so I apparently do NOT have to replace it to accomodate all 4MB, right?

4) Would appreciate additional tips anyone might have to make the upgrade a successful one. Thanks to all. DF

It is true that the delay is due to DSP implimentation.

BUT it's not because Behne&Behne will use the DSP for speeding up normal
CPU-like
things. They just mean that they are implementing the neccessary DSP-system-
calls requiered to make MagiC 3 compatible with specific Falcon-applications
that uses the DSP-chip thru the operating system, which in this case
is MagiC 3.

Actually the current MagiC 3 version for ST/TT, can be patched to run on
the Falcon with the same features as on the TT. The ONLY applications
that can't be run under current version of MagiC 3 on the Falcon
are programs that uses the DSP.

Get the idea? :-)

Keep Cool and Flying...

I'm sure people will be along with much fuller answers than these - but
here is the basics.

> - where can I find a FAQ? I spent the weekend visiting numerous
> sites only to find nothing of the such.

I'm not sure there is a FAQ. There are several FAQs for specific techie
type things - but I've not seen a general FAQ :-(

> - what are the general specs of the 520ST? speed memory resolution

There are several models of ST you might have:

ST
STM
STF
STFM

The 'M' stands for TV modulator
The 'F' stands for built in floppy.

Otherwise:
8Mhz 68000
512K RAM
320x200 in 16 colours on TV or RGB monitor
640x200 in 4 colours on TV or RGB monitor
640x400 in monchrome with appropriate Hi-Res monitor

> - can I hook up my NEC Multisync 3V to it? (since I doubt the TV
> would do it justice)

Most likely - though whether it will do the 640x400 mode I don't know.

> - what would I need to get Linux up & running on it (for starters
> I know I'd need a HD...size?) is it capable of running
> Linux?

Linux won't run on this Atari. You will need either an expensive CPU
upgrade card - or a Atari TT or Atari Falcon.

Quite honestly if you want to fun Linux and don't already have most the
Atari hardware necessary (and you don't ;-), you'd be better off buying

a PC.

There is a Unix like extension called MiNT which will work on an ST and provides much of the fuctionality you would have had from Linux. It still needs a couple of Mbs RAM and a hard disk to be useful IMHO.

OTOH even a basic ST can be quite a useful machine - and there is lots of software available for it.

:-)

Roland.

Nope, Gemulator needs a board, but it just holds up to 3 (I think) sets of
TOS ROMS. The 68000 code has to be interpreted in x86 code.

Phil.

I have not been able to find any Mac comms application that is half as good
as Connect. So I just use Connect under MagiC Mac :-)

It doesn't require 8Mb to run, although I would recommend 8Mb for any serious work - System 7 uses at least 2 of these. MagiC and Ease use another 1Mb. Disk space is not an issue - you need less than 1Mb for the full installation.

> BTW, wouldn't it be easier just to run the Atari version of

It wouldn't be as fast.

It is nonsense for varius reasons. The memory requirements Roger quoted have
no relation to reality, for example. I have used UIS for a long time, I
bought it a while back from the ST Club. Feel free to send me the latest
version for review in Atari World.

Pascal Roche (proche@isis) wrote:
: BTW, is Towers 1 worth downloading ?

Yes, that is of course, if you are a Dungeon Master fan. Towers I is stepwise/90degree movement, and has an interface very similar to DM. In addition, if I remember correctly, it is networkable (allowing you and a friend to run around the same dungeon).

With the previous talk about the resale value of computers such as the Falcon, I am forced to wonder why people aren't considering the _value_ of the machine as far as usefulness, enjoyability, ease of use, etc... Isn't this more important? I don't buy a car solely because it will have a good resale later, I buy it for what it will do while I own it.
I may never be able to find anyone to buy my Falcon - but why would I want to? If it meets my needs, or serves some purpose - why be concerned about anything else. The bottom line is that if the machine can help me to be creative, have fun, and make money, then it will have been worth every penny.
My only regret is that I didn't buy a Falcon sooner.

It was none other than Keith Sunderland who did write on 02 May 95 that ....
KS> Just a thought. At the moment I am loading my existing TOS 1.4
KS> (1.62) into RAM as I run WINX. Would it be possible to load TOS 2.06
KS> in the same way instead of my existing one?

When you say TOS you mean you are using ROMSPEED or are you using GEMRAM to
just load the bits that WinX needs.

GEMRAM(or ROSMPSEED) and WinX work perfectly well with 2.06 in fact there are
some features of WinX that are only possible with the version of the AES that
is within TOS2.06 ..i.e 3.40 IIRC.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

For Sale:

1040STFM mostly works, good for spare parts, asking $50.00

DS/DD Ext. disk drive, works great, asking $40.00

2 Monochrome Monitors, both work good, asking $40.00 for each

Spectra GCR ver.3.0 with Mac system Disk, asking $90.00 (roms too!)

ICD Host Adapter with shoe box and 50 Meg SCSI hard drive, asking $100.00

Several commercial Software packages: PageStream, Diamond Back and Edge,
Diamond Data Lite, DC-Shower, DC-Utils, GFA Basic 3.0,Etc, asking $100.00
for these items.

All items do not include shipping.

Please send mail to Howe@ukpr.uky.edu or this address.

Thanks.

If memory serves correctly, 8 data bits, No parity and 1 stop bit should
work fine (often referred to as 8N1). The strip bit option, if selected
will strip the high bit off any incoming information, so you won't get
any bytes above 127 in value. In most cases, you shouldn't need to turn
this on.

Hope this helps!

I think you need to talk to Steve Cohen. He already plans a "Falcon"
clone as discussed on Genie a month ago. I spoke to him about a
week ago and even those plans have changed and he is working at a
unit utilizing the Power PC chip. He felt that TOS/MAC OS/PC would
be a more versital unit than what was discussed on line, especially
now that the Mac OS is up for use. It is the stuff that Falcons
dream of, aside from Apex Media, of course.

2252. Shoestring Computers User Survey

Newsgroup: comp.sys.atari.st
Date: 1995-05-06 00:00:00 UTC
From: DOMINGO@news.delphi.com
Message-ID: <3offal$br7@news2.delphi.com>
Source record: 166165

** SURVEY ** SHOESTRING COMPUTERS ** SURVEY ** SHOESTRING COMPUTERS **

Here is a short survey to help me better determine the needs of current Atari users. I will use your answers to help point Shoestring Computers in the right direction. If there is anything that you feel I have overlooked, feel free to make additional comments at the end.

1) Which Atari ST series computer(s) do you have? If you have more than one please list them all. Also include your TOS version and RAM.

2) What is the primary use of your ST?

3) Secondary?

4) Do you have any hardware upgrades installed in your computer(s)?

5) Do you own a hard drive? Please list the host adapter and the size of the drive as well as the driver software version you are using.

6) Do you own a modem? Please list the manufacturer as well as your primary telecommunications software. (If you don't own a modem, how did you get this survey? <smirk>)

7) Do you own a printer? Please list the manufacturer. Also list the RAM size if it is a laser printer.

8) Do you own any other peripherals?

9) Please name the last hardware purchase you made.

A) Please name your three most wanted hardware items, including upgrades (available OR unavailable).

B) Please name your top three software applications (no games).

C) Please name the last three software purchases you made (shareware counts).

D) Please name your three most wanted software items (available OR unavailable).

Thank you for taking the time to answer this survey. If you have any other comments or suggestions, please do not hesitate to include them. I hope to be able to serve you in the best possible way. Please e-mail your responses to one of the addresses below.

>remebered how?

I recognize this very much.

There are some such brave souls. But unfortunately their setup programs
are often so much tuned to their situation that it is almost impossible
to use them on any other machine.

One of the problems is some people prefer to chuck everything into
mint.cnf, others use 'init', etc. etc. (It would all be easy if
mint.cnf didn't exist, at least not in its current form, I guess).

For example there's MiNTnet, and the MiNTnet distribution is fairly
OK in itself. But it tells you to get a nice MiNT setup, preferably
MiNTOS. Now if you merge the /etc directories from MiNTOS and MiNTnet,
it takes DAYS to find out which files belong to which, etc, and MONTHS
to get a proper networking setup going.

Yes, it is time some of the MiNT fanatics started putting his or her(? :-)
thoughts in order and made a reasonably fool-proof setup. And complete
as well.

(I'd do it if I had the time... but many MiNT fans really do have the
time---considering the loads of UNIX rubbish they spend their time
porting on a daily basis)

: Ooops. There shouldn't be any problem with Unix linefeeds.
: Do you mean 'normal' ASCII files or HTML files?

It was html files that were causing the problem. After the software had
been hammering my HD for about 30secs I gave up and rebooted. After
converting the same file to CRLF things were fine.

My TOS version is 4.04 (same happens with MiNT 1.12h3).

: : Do you mean 'normal' ASCII files or HTML files?
: O.K. folks I'm a bit stupid when it comes to anything other than eMail/news..
: HOW do I get these HTML files ????? I want to try it out !!!!!!

To get the files, you will normally have to use a web browser.
Lynx/MiNTnet will work fine for text browsing, and you can save an HTML
file by downloading a link. Unfortunately, getting the pictures that go
in web pages will be slightly more difficult, unless you find the exact
URL by looking through the HTML of the document the picture's in.

Alternatively, there's an email-WWW interface (at info.cern.ch IIRC) which
I think allows you to receive unprocessed HTML. If anyone's interested
I'll find and post some more info.

Sorry, I cannot say I have experienced any of the problems you have in the 5 years I've been using my Mac.

> only one not understanding the "Mac logic". One example: who can really
> say it's logical to eject a floppy by "dragging its icon to trashbin" ?

No one, in fact this was so hotly debated that in System 7 they changed it to the "Put Away" command. Put away also remembers where you had things before you moved them, so you could drop something in the trash, and later simply say "Put Away" and it does.

> Somehow I *knew* you'd say that..! And it's an opinion as good as mine.
> I disagree completely, but then again - you've found your dream machine,
> I've found something I like.

The Atari needs these gizmos in the file selector because you can't switch to the file manager and do work.

> together, naturally. I just hate to use TOS 1.0..1.4 or MacOS file
> selector, see a file I want to delete immediately - and not be able to
> select that file, and push "delete" button (or control-D). This really

You don't, you switch to the Finder with a single click, and drag the item to the trash. End of story.

> If you want it that way, fine... But if you don't?

Then you use SuperBoomerang with adds all the gizmos you mention and more.

> to choose the way I handle files. Mac doesn't let me do that.

Yes it does.

For someone that claims to "know" the Mac, it's pretty obvious to me you don't.

: >with NeoDesk) are too dumb to see the light =-) !

: The problems you have with icons being placed strangely are probably caused
: when you create new documents or use installers -- I've had that happen to
: me too, after I installed a new program. Keep in mind, though, that in such
: cases it's the fault of the program, not the Mac. Once you place an icon where
: you want it, the Mac doesn't move it until you tell it to.

They happen very often, when I use DOS-floppies (as I have to do
frequently). Since a "fresh" DOS-disk doesn't have any icon information
for Mac, it all has to be created there. And that's when strange things
happen. I think it's a bug somewhere. Another bug that probably doesn't
occur, unless you use DOS-floppies is this: after saving e.g. pictures
into a DOS-disk (using System 7), the desktop tends to show the file
sizes incorrectly. The only way to correct the situation, is to eject the
disk - and let MacOS read the floppy information again.

I feel, actually, that many of those problems I've faced with Mac, have
something to do with DOS-world. It seems to me, like Apple's MS-DOS
compatibility is still somewhat buggy. As is TOS, and other OS' as well.
Many Mac-users probably never use many DOS-floppies, or (especially)
their Atari-cousins, and experience therefore quite different problems..

: Well, the official way to eject a floppy on the Mac is to use the "Put Away"
: command from the File menu. (It returns desktop and trashed items to their
: original locations, and ejects and removes floppy icons.)

: Dragging the floppy icon to the trash to eject it is strange, but it's not the
: only way, and it is convenient. I remember an Apple programmer was asked
: about this on one of the comp.sys.mac.* groups, and his reply was that they
: really couldn't think of a better way of doing it. It is frightening to the
: new user the first time, but after a while you get used it. (Unfortunately
: no user interface is perfect!)

Macintosh is a structured working environment; the programs look pretty
similar, and everything has been strongly standardized. Although I find
this good for beginners (Mac is easier to learn than Atari), I miss the
freedom Atari-environment gives me. I somehow like the programs looking
different, freedom to format a floppy to 1.8 Mb instead of 1.44 - when I

need more space, freedom to choose between many completely different
desktops, etc. It gives me the feeling I'm controlling the computer, and
not vice versa. With Mac I too often find myself wondering: "what is this
thing doing..?" I have to trust that it does what it's supposed to do.
And knowing computers: if something can go wrong, it probably will... =-)

: The problem I had with them specifically was that the replacement selectors
: were always very bulky, taking up a lot of screen space, and that they were
: never very user-friendly. In my mind, the Desktop is a much more natural
: place for file manipulation; the interface provided by the file selector is
: not designed for file manipulation.

Not user friendly? Hmmm... Not for a beginner, I agree. But for a
"power user", e.g. Selectric offers fantastic possibilities. You can, for
example, rename a group of files very quickly, choose a often-used path
with one keystroke, and write-protect individual files as you see them.
It happens to me very often: you see some important file, and think:
"that name isn't good - and I'll have to protect it against deletion".
That all is done in seconds. It soon becomes your second nature to do
file-management with the same tool you select files. And you'll wonder,
why anybody would do it in another way.

: I agree that in a single-tasking system, there is a need for file management
: from within the application. I simply don't think that, in human interface
: terms, the file selector is the appropriate place. Dialogue boxes are not
: and should not be used for that type of interaction; they were intended to
: get a bit of information from the user and disappear. Using something like
: a dialogue, which was never intended to provide the kind of interface required
: for sophisticated file management, results in a much more difficult interface.
: It wouldn't have been hard for Atari to provide a simple file-management DA
: with the system... But then again, this entire thread is about what Atari
: *could* have done!

But that exists..! Tools like "Harlekin" offer all that, as a DA. I just
don't like the idea of having to change the tool for e.g. file deletion.
It feels clumsy. Do you believe that there exists some certain human
interface that's ideal for everyone? Left-handed, logical, unlogical,
people who like to write commands, people who prefer mouseclicks, ...?

: I think that what should be done is what research shows is the most efficient
: and most friendly way. Remember when graphical interfaces were new and
: all the command-line lovers scoffed at graphical interfaces because they
: claimed they were childish and inefficient? Sometimes what people believe is
: the best turns out not to be the best, quickest, most efficient, etc., when
: research is done.

I remember that all-too-well... PC-magazines treated Mac as a joke. And
some still do. Atari and Amiga were too small to get any comments...
I don't personally believe in research too much. There are just far too
many completely differently thinking people around. And a compromise is
always a compromise. I believe rather in computers that change
themselves to please both command-line interpreter freaks, and

GUI-lovers. Very customizeable computers. Those aren't the easiest to learn, but after you know what you're doing, they offer the best from both worlds. For me, Atari has been closest to that, although far from perfect. Especially Falcon-TOS fulfills my needs pretty well.

Greetings,

Tommi

: Sorry, I cannot say I have experienced any of the problems you have in
: the 5 years I've been using my Mac.

That doesn't mean that there are no problems like that. We may use
different applications, in different environment, etc.

: The Atari needs these gizmos in the file selector because you can't
: switch to the file manager and do work.

That's absolutely false. I use MultiTOS (AES 4.1) a lot - and with that,
I'm perfectly capable of using the file manager while working. I wonder,
why so many people don't realize that Atari is capable of multitasking?
Or if you don't like MTOS (4.1 is actually very good!), you can always
use Geneva or MagiC! Two of those three use pre-emptive (real)
multitasking method - unlike Windows 3.1 and MacOS, which only do
co-operative multitasking / task-switching.

But... I use Selectric, even then. It's one of the greatest improvements
for computers user-friendliness (and effectiveness) I've ever seen. All IMHO.

: > together, naturally. I just hate to use TOS 1.0..1.4 or MacOS file
: > selector, see a file I want to delete immediately - and not be able to
: > select that file, and push "delete" button (or control-D). This really
: > shows how different needs people have !

: You don't, you switch to the Finder with a single click, and drag the
: item to the trash. End of story.

It's not as simple and fast. Especially, if you have to select and get
rid of many files. You may find that easy and convinient, but I
definitely don't.. Remember: MultiTOS behaves in the same way as MacOS
(you can even use a recoverable trashbin), so I know what you mean. My
own "working habits", however, are probably different from yours in many

ways. I really need those extra-features in a fileselector.

: For someone that claims to "know" the Mac, it's pretty obvious to me you
: don't.

What about your Atari-knowledge ;-) MultiTOS, Falcon-TOS, etc. I could say exactly the same. But I don't. Just like English isn't my mother tongue (and I make mistakes), Mac isn't the computer I own. Still, I use those both a lot. And if a computer claims to be as easy to learn as Mac does - I shouldn't experience the problems I do?

The problem with people like you is that you really *believe* that Mac is superior to other computers - and you just can't understand that someone isn't happy with it, without being a fool (or inexperienced, etc.).

Therefore you approach me (ant the others) with this "I know more than you know, so don't argue!" -attitude. You can't stand that someone claims Mac isn't perfect. Even worse: some people think TOS is better.. They can't be right - can they? Because Mac is a "superset" of Atari. Or is it? People like you like to tell the owners of "inferior computers" what the TRUTH is. They think they're good persons when telling the ignorant, dying Atari-world that there's hope. And that hope is Mac - or a PC. You just don't listen to what we have to say?
And if you do, you won't believe what you hear?
It's a pity. Conversation requires two sides: both willing to not only speak, but listen, too. And things seldom are black and white. Anybody coming here, telling: "Mac (or whatever) is in every way better than whatever you use..." simply speaks bullshit. It's waste of time, because it's simply not true.

: Maury

Cheers,

TH (may you some day own a Falcon ;-)

Maury:

Regarding the differences/features of the STe series...

Video: Nothing really different over the original ST except that the Shifter chip (video hardware) was upgraded to support 4096 colors just like the Amiga. The 16 color limit was still there except that programs could use the enhanced palette. Big deal!

Of course, the biggest addition to the STe's video was the inclusion of the BLiTter chip which was designed to speed up graphics, etc. It was a big disappointment. Unlike the Amiga's Blitter, the STe's was just a hardware implementation of the BitBlit raster copy routines in the ST's Line-A interface. Sure, animation was speed up dramatically but most other screen graphics weren't improved too much (maybe by 5-10%) and the chip was really limited in what it could do, etc.

Another enhancement to the STe's video was the addition of a fine horizontal scroll capability - primarily useful for games.

Sound: The STe series retained the Yamaha/GI sound chip but also added two D/A converters that could play 8bit digital samples up to 50khz. The output of this hardware was stereo and they had full DMA access so they didn't tie up the hardware. An interesting feature of the STe's new sound capabilities was that they could be combined - i.e you could use the DMA sound output along with the GI sound, etc.

TOS: Much improved over previous versions. TOS 1.6 had an improved file selector (as in 1.4), full MS-DOS complient disk formatting, better HD access, better and more stable memory routines (less bugs, etc.), full support for the Blitter and new palette, a file move capability, and the ability to reset the computer using the Ctrl-Alt-Del sequence (like the PC).

RAM: The STe used SIMM modules so upgrading ram was never easier and safer.

CPU: The STe used a socketed 68000 chip - allowing for less mess when using certain upgrades and/or emulations, etc.

JOYSTICKS: The STe introduced new 'enhanced' joystick ports. This made it possible for 6 player games (never saw any) and I think they're compatible with the Jaguar's.

Compared to my older ST, the STe was a joy to use and inexpensive ($400 in 1991). However, it wasn't the great new machine that everyone thought it would be - just an enhanced version. The later Falcon 030 (which I would later own) was what the STe should have been.

Hope this helps...

Ari

Well I remember reading a review of PC GEM quite some time before the ST
surfaced. It looked a lot more like the MAC OS than the version of GEM that
was shipped with the very first STs - so I'm pretty sure the PC version
was first.

:-)

: It doesn't put the icons in peculiar places, it puts the icons where the user
: places them. If you want the icons arranged neatly, then you can arrange them
: in whatever way you want. The Mac will also snap them to an invisible grid
: if you want.

I disagree with that. Too often you can swear you haven't touched any
icon - and somehow, very intelligently, Mac builds a nice pile of icons:
one on top of another.. Quite unbelievable, actually. The way it
"arranges" the icons automatically, is also... interesting. It must have
some great logic behind it - but unfortunately we Atari-users (spoiled
with NeoDesk) are too dumb to see the light =-) !

It's kind of interesting: MacOS does all kinds of things very willingly,
but few things the way I *want* it to do them... And no, my friends - it's
not because I don't know how to use Mac. That's the easy explanation,
when one doesn't know any other possibility. And I'm definitely not the
only one not understanding the "Mac logic". One example: who can really
say it's logical to eject a floppy by "dragging its icon to trashbin" ?
I've discussed this with some friends - with no success. It makes no
sense, no matter how one sees it. Trashbin => trash. Trash is to be
deleted. Or what? Disk to trash => delete trash from disk => delete
files, or format the disk. Logical. Or do Mac users have different
brain and different meanings for objects ;-) ?

: >The fileselector is (again IMHO) inferior compared to
: >Selectric, or Universal Item Selector 3.

: I've always despised those replacement file selectors for the ST. In my
: opinion, the Atari file selector in TOS 1.4 and later was just fine, because
: it did exactly what it was suppposed to do: allow the user to select files.

Somehow I *knew* you'd say that..! And it's an opinion as good as mine.
I disagree completely, but then again - you've found your dream machine,
I've found something I like.

: Adding all those buttons to delete files, rename files, create folders, and
: so on simply clutters up the interface. After TOS 1.4, I don't think most
: people had problems with the file selector because it wasn't good for

: selecting files -- once the problems with the old (TOS 1.0/1.2) version had
: been fixed, it did its job just fine. People wanted file management from
: within their applications, and they used those weird replacement file
: selectors to get it. Atari could have addressed this by providing either a
: simple desk accessory to provide simple file management, or by providing a
: multitasking operating system.

You're the first Atarian I've ever heard to say that. No wonder you
changed to Mac... For me the file selection *and* -management belong
together, naturally. I just hate to use TOS 1.0..1.4 or MacOS file
selector, see a file I want to delete immediately - and not be able to
select that file, and push "delete" button (or control-D). This really
shows how different needs people have !

: The Mac File selector does just what it's meant to do, and it does a good
: job -- it allows the user to select files. If you want to do file management,
: then you can switch to the Finder for file management.

If you want it that way, fine... But if you don't? Then GEM/Selectric
does the job much better. Do you think that people should adapt their
needs to the system they use - instead of vice versa? I want to be able
to choose the way I handle files. Mac doesn't let me do that.

: In my opinion, a file selector box is NOT the proper place for file management,
: on either the Mac or the Atari.

And in my opinion, it *is* the proper place. What would that tell us, if
e.g. 44% of users agreed with you, 44% with me, and 12% wouldn't care?
Again, I think that one must be able to choose the preferred way.

: >Some people like those
: >pull-down menus. I don't: I prefer GEM's drop-down system.

: Just as there are (or were, I don't know if they are still around) utilities
: to make the Atari's menus pull-down, there are utilities to make the Mac's
: menus drop-down.

That's interesting.. I wonder, if those are for ex-Atarians ;-) ? Btw,
Geneva lets one decide the way menus behave. So does MagiCMac, MagiC, etc.

Cheers, and let's be happy with what we have!

Tommi (some time ago seriously considering getting a Mac..)

The problems you have with icons being placed strangely are probably caused
when you create new documents or use installers -- I've had that happen to
me too, after I installed a new program. Keep in mind, though, that in such
cases it's the fault of the program, not the Mac. Once you place an icon where
you want it, the Mac doesn't move it until you tell it to.

Well, the official way to eject a floppy on the Mac is to use the "Put Away"
command from the File menu. (It returns desktop and trashed items to their
original locations, and ejects and removes floppy icons.)

Dragging the floppy icon to the trash to eject it is strange, but it's not the
only way, and it is convenient. I remember an Apple programmer was asked
about this on one of the comp.sys.mac.* groups, and his reply was that they
really couldn't think of a better way of doing it. It is frightening to the
new user the first time, but after a while you get used it. (Unfortunately
no user interface is perfect!)

>: I've always despised those replacement file selectors for the ST. In my

>I disagree completely, but then again - you've found your dream machine,
>I've found something I like.

The problem I had with them specifically was that the replacement selectors
were always very bulky, taking up a lot of screen space, and that they were
never very user-friendly. In my mind, the Desktop is a much more natural
place for file manipulation; the interface provided by the file selector is
not designed for file manipulation.

>: The Mac File selector does just what it's meant to do, and it does a good
>: job--it allows the user to select files. If you want to do file management,
>: then you can switch to the Finder for file management.
>

>does the job much better. Do you think that people should adapt their
>needs to the system they use - instead of vice versa? I want to be able
>to choose the way I handle files. Mac doesn't let me do that.

That's not true; there are replacement file selectors for the Mac. In
my experience, they're not as popular on the Mac as they are on the Atari.

>: In my opinion, a file selector box is NOT the proper place for file management,
>: on either the Mac or the Atari.
>
>And in my opinion, it *is* the proper place. What would that tell us, if
>e.g. 44% of users agreed with you, 44% with me, and 12% wouldn't care?
>Again, I think that one must be able to choose the preferred way.

I agree that in a single-tasking system, there is a need for file management
from within the application. I simply don't think that, in human interface
terms, the file selector is the appropriate place. Dialogue boxes are not
and should not be used for that type of interaction; they were intended to
get a bit of information from the user and disappear. Using something like
a dialogue, which was never intended to provide the kind of interface required
for sophisticated file management, results in a much more difficult interface.
It wouldn't have been hard for Atari to provide a simple file-management DA
with the system... But then again, this entire thread is about what Atari
could have done!

I think that what should be done is what research shows is the most efficient
and most friendly way. Remember when graphical interfaces were new and
all the command-line lovers scoffed at graphical interfaces because they
claimed they were childish and inefficient? Sometimes what people believe is
the best turns out not to be the best, quickest, most efficient, etc., when
research is done.

>Cheers, and let's be happy with what we have!

I hope I don't get flamed for mentioning the Mac in my posts. I'm not trying
to tell anyone what machine to use ... use whatever machine you want.

2274. Is Atari Alive anywhere?

Newsgroup: comp.sys.atari.st
Date: 1995-05-06 00:00:00 UTC
From: shelson@hg.uleth.ca
Message-ID: <3of3ov$fn2@holly.cc.uleth.ca>
Source record: 166187

I am posting this for a friend who owns an Atari 520 ST. He and I have
been discussing Atari in general and he wonders whether there are ANY
Atari's being produced and sold anyplace in the world. I told him there
were certainly some active discussion groups on the Net but from my
cursory monitoring of the groups it was my IMPRESSION that Atari has
gone the way of the Dinosaurs and the Dodo bird. Is that correct?
I will follow this group to look for replies unless this is the wrong place
to post this. In that case please suggest where I might post it more
appropriately.

Thanks in Advance!

Richard Shelson

Absolutly not! Atari manufactures the worlds first 64-bit Multi Media
Entertainment System, the Jaguar. It's available at Babages, Waldensoft,
Electronic Boteque & some other places like that. Check out the general
Atari video game news group or the Jaguar specific one for more info.
They very recently came out with the came out with the Falcon 030 computer
system but I only have a 1040 STe so I don't know much about it. They
still have the Lynx, the worlds only 16-bit portable game system. TOAD
Computers is a great mail order catalog of Atari products both new & old
in case you're interested. Sometime soon a CD ROM is due out for the
Jaguar & Jeff Minter (programmer of Llamatron on ST's & Tempest 2000 on
Jaguar) is making a new game, Defender 2000, which will use the CD ROM.
All of his games are EXCELLENT & from what I've heard Defender 2000 will
probably be his best. Hope this has helped.
Peace,
JJH

>> Get FTPOV. Its a hell of a lot faster and it's completely
>> compatible...
DA>
DA>
DA> So is anyone ever gonig to make this available on the net?

I've got it right here, but I can't get full internet access.

I uploaded it onto Falcon/Atari BBS boards, and even onto RayTech BBS which supports POV and all the other raytracers for PC / MAC / ST & Falcon / Amiga / Archimedes.

You may find it hard to get elsewhere, as I'm the guy who ported the source, mind you, it wasn't exactly a great feat of mankind - so I'm puzzled it has not spread more quickly. I even uploaded the source and about 5 megs of demo POV files.

Try RayTech - if you are at all interested in raytracing, it's worth getting on there anyway.

Cheers,

Doug.

Get real Ofir. Nobody would continue developing a computer if it only sold
15.000 in three years. That makes no sense at all. Perhaps if we asked
C-Lab we would get a better picture of how big the Falcon market really
is. 15.000 is way out of hand.

Hooray, it's the fileselector debate again! B^{)

I've been a UIS user for a few years now and I'm happy to agree that it's pretty good. I also think Ofir's 'nonsense' comment is a bit strong, but I don't think I'd disagree with him, all things considered.

The usual emphasis in these debates usually concentrate on the number of files UIS can display, but it really is a red herring. Do <you> use UIS in 142 file display mode? I'd guess not. If you do, do you enjoy

squinting at the screen to find your file? The point is that by simply typing the first letter of the file you want (in Selectric) you get the file you want in immediate view and selected. The point is that as a <file selector> UIS has fallen behind.

Factors like multiple file selection, handling of more than 256 files in a directory, returning to a directory at the same point as when the FS was last called etc. go to prove the point even more.

There's one reason alone that I continue to use it over the newer ones and that is because I can view a text file without executing another program or loading the entire text file into memory. Nothing else is as quick or neat. If that were sorted in the other FSs I'd switch straight away.

> This UIS.III is still supported and is in version 3.32. Contact A&D
> Software thru ST Informer Magazine for any more details.

Really? This comment is a little more worth a 'nonsense' response. UIS v3.32 has a copyright date of 1989. Supported? I think not.

The joystick port? One pin of the TT mouse connector is connected to one of the joystick directions (up? I don't remember), so you can connect 3-button-mice to the TT. This connection is supported by MiNT-X11, for example.

AG>3. X11R5 and .xinitrc - it seems that X doesn't understand DOS style

Hi Annius!

AG>1. Ataris and 3-button mice. Can I use a 3-button mouse that is
AG>connected to the joystick port? One that is connected to a serial
AG>port of the TT? With MiNT only, or possibly also under plain TOS?

Both is possible. For plain TOS there are at least two drivers to use serial mouses with two or three buttons. X11R5 for MiNT does also support serial mouses.

AG>2. X11R5 for MiNT. Are there any xmodmap files available for a UK
AG>keyboard?

I remember that I saw it on a ftp site, but didn't remember which site it was.

AG>3. X11R5 and .xinitrc - it seems that X doesn't understand DOS style
AG>newlines.

That's absolutely correct as MiNT tries to be as UNIXish as possible. And under UNIX, all lines are terminated by a single newline character (ASCII 10).

Greetings,
/Daniel/

[...]
>Gemini has the same problem - so whats the solution?

I guess, the accessory you are using, does not use the AVSERVER variable
and only tries to communicate with application 0, wich is the 'main
application' under single TOS.

Try one of the following programs - they support AVSERVER and work
fine with Thing or Gemini:

ST-Guide
ParaFin (1.34 or later)
TreeView 2.4
AES-Lupe (i don't know if there is an english version too)

I've tested these tools with MultiTOS, MagiC!3 and Thing and Gemini.
They all work fine and understand D&D etc.

BTW: The next version of Thing will support the MultiTOS D&D protocol
also ;-)

Ciao...

Why not subscribe, you can cancel if you don't like it. It costs 12.50 UK pounds for 3 issues including postage outside EU countries.

If you want the optional reader disks the total is 17.00 pounds for 3 issues.

Within EU the prices are 3.00 pounds less, or within UK 5.00 pounds less.

You can use Visa or Mastercard.

The phone number for subscriptions is UK 01487 773 543 (9.30 - 19.00 UK time, Mon - Fri), or post to:

From: jperez@uhunix3.uhcc.Hawaii.Edu
Message-ID: <D87L7I.MAt@news.hawaii.edu>
Source record: 166006

Can anyone recommend an accounts program that is Falcon
compatible? I have a small service oriented business and I require a
program to generate invoices, track income, taxes, etc... I am having
difficulty finding an appropriate piece of software.
I have tried Mega Check 2 and ST Accounts, which do not run
properly on the Falcon. I have also tried Home Accounts 2 and Phasar,
neither of which do invoices. I am seriously interested in finding a
program called Biz Accounts, from Orpheus software, but cannot locate it
anywhere. Other than that, I can't think of any other appropriate
accounts packages.

Please help me if you can. Also, if anyone has and would like to
sell Biz Accounts, please contact me.

Aloha,

It was none other than Steve Taylor who did write on 1 May 95 that ....
ST> : Atari UK doesn't have an email address.
ST> erm... atari@cix.compulink.co.uk abodin@cix.compulink.co.uk

Daryll Still ,Atari UK head of Marketing IIRC,is also on NeST FTN network
although only really to support the Jaguar .. I have only seen him post in the
Games based msg areas.

He will however answer netmail about TOS/computer based projects (i.e none)
very honestly.

Daron (Brewood) is setting up a NeST Email Gateway I think ,maybe he can
explain if it is possible to mail him via Email through this gate ?

Whilst on this subject anyone who still uses and ENJOYS there Atari should get
linked into NeST as it is great to be able to speak to fellow enthusiasts
without having to wade through all the waffling about PC's and MAC's and how
cr*p Atari are . There is a significantly large community of Falcon users on
there should anyone be interested .

You'll have to wait for the next rev of Geneva, as the current one is not
compatible with MiNT.

Good to hear! I'd like a list like that to stick under tho nose of anyone complaining about the Atari games market. There *are* some great games around - let's appreciate that!

Yours sincerely

2298. ST XFormer cable?

Newsgroup: comp.sys.atari.st
Date: 1995-05-07 00:00:00 UTC
From: followel@ix.netcom.com
Message-ID: <3oh7d9$bct@ixnews3.ix.netcom.com>
Source record: 166063

Hello All,

I've started using the old ST XFormer and PC Xformer again. I'd like to make an XFormer cable so that I can hook my 8 bit drive directly to my ST. I know there was a pinout / instruction file floating around at one ti
me. Can someone direct me to this file or tell me the pinouts of the cable ends so that I can make my own? It would be greatly appreciated. Thanks in advance.

Sincerely,
Byron Followell
followel@ix.netcom.com

P.S. - I'm sure i'll have several posts concerning where I could buy a cable or people who are interested in selling me their old one's, however, as I have ton's of spare parts around the house, i'd like build my own.

>happen. I think it's a bug somewhere.

Well, I've never had this. I'm using System 7.5.1 with PC Exchange 2.0.3.
When I insert a DOS disk that hasn't been inserted before it never overlaps
the icons in one big pile.

Now that I think about it, perhaps your referring to the fact that when you
tell the Mac to clean up the window, or when you insert a fresh DOS disk, the
Mac arranges the icons so that none of the names below the icons overlap.
If some of the icons have long names, it can result in the icons being
unevenly spaced. This is not a bug, it's a feature that ensures that you can
always read the icon names.

>Another bug that probably doesn't

Once again, I've not had that problem. Maybe you should upgrade to the latest
version of PC Exchange.

>thing doing..?" I have to trust that it does what it's supposed to do.
>And knowing computers: if something can go wrong, it probably will... =-)

I think you're confusing two issues here: a standard interface versus the ability to customise. The Mac interface is standardised (most programs adhere to the Human Interface Guidleines) but that doesn't mean it's not customisable. If you took a look at the info-mac ftp archives, or mac.archive at the University of Michigan, or any of the other Mac FTP sites, you'd see the tons of extensions and control panels out there that let you customise the interface, and add new features. To respond to your specific example re: replacement desktops or file selectors, the simple answer is that the ones provided by Apple are so good that there is no desire on the part of users to purchase any third-party replacements. Remember, the Mac software market is also capitalistic -- if there is a demand, someone will take the initiative and come up with a product to satisfy the demand.

The entire philosophy behind the Macintosh Human Interface is that it is the USER that controls the computer, not the other way around. (I could quote you the relevant section of the guidelines, but I'm sure that's not necessary.) If I have to learn a new interface for each program, then it is the computer which is forcing me to adapt to its needs, not the other way around.

>Not user friendly? Hmmm... Not for a beginner, I agree. But for a
>"power user", e.g. Selectric offers fantastic possibilities. You can, for
>example, rename a group of files very quickly, choose a often-used path
>with one keystroke, and write-protect individual files as you see them.
>It happens to me very often: you see some important file, and think:
>"that name isn't good - and I'll have to protect it against deletion".
>That all is done in seconds. It soon becomes your second nature to do
>file-management with the same tool you select files. And you'll wonder,
>why anybody would do it in another way.

The reason file selector replacements evolved on the Atari was because of the need to do stuff like format disks from within an application, to delete files to make room on a disk, and so on. The need arose because of the lack of multitasking on the early STs. Atari provided no way for to do any sort of file management from within applications. I really don't think most users open the file selector to save or open a file, see a file and suddenly think "Gee, I should delete that file!" or "Gee, I should really rename that file!" They either open the file selector to select a file, or they open it with the express purpose (if it's a replacement) of doing file management tasks.

>It feels clumsy. Do you believe that there exists some certain human
>interface that's ideal for everyone? Left-handed, logical, unlogical,
>people who like to write commands, people who prefer mouseclicks, ...?

Just because people prefer something doesn't mean it's better for them. Research allows us to PROVE that. Apple has done *extensive* research in the area of human interface design. They didn't just pluck their human interface out of thin air.

>I don't personally believe in research too much. There are just far too
>many completely differently thinking people around. And a compromise is
>always a compromise.

But don't you see? If interface X allows a users to complete a task in ten
seconds with an accuracy rate of 90%, and interface Y allows users to complete
the same task in fifteen seconds with an accuracy rate of 70%, then isn't
it self evident that interface X is superior?

Check your SCSI cables with an ohm meter and make sure they are wired pin 1
to pin 1, pin 2 to pin 2, and so on, for all 25 or 50 pins (depends on your
drive type). I bought some so-called "SCSI" cables that were 50 pin, but pins
1-25 were jumpered! They didn't work - in fact they brought down my whole
SCSI chain. So make sure your cables are the "pass_through" type before you
look elsewhere. Good luck!

: the icons in one big pile.

Really strange.. That happened when using Mac Quadras at my home university in Finland (where the guy responsible of Macs was one hell of a "guru" ;-) - and it happens here, at Georgia State University. The machines are Centris 660 AVs and Quadras. This is one of the mysteries of computer world: some people always experience something the others face never - no matter what machine you use!

: Now that I think about it, perhaps your referring to the fact that when you

No - that feature is familiar to me. The logic behind the "arrange" command just differs very much from what I've used to see on Atari's Neo Desk (for example). I guess I'd get used to it.

: >Another bug that probably doesn't
: >occur, unless you use DOS-floppies is this: after saving e.g. pictures

: purchase any third-party replacements. Remember, the Mac software market is

: also capitalistic -- if there is a demand, someone will take the initiative
: and come up with a product to satisfy the demand.

Could it be that certain kind of people choose Macintosh? Just like
certain kind of people prefer Atari, Linux, or whatever minority systems.

: The entire philosophy behind the Macintosh Human Interface is that it is the
: USER that controls the computer, not the other way around. (I could quote
: you the relevant section of the guidelines, but I'm sure that's not necessary.)
: If I have to learn a new interface for each program, then it is the computer
: which is forcing me to adapt to its needs, not the other way around.

You see it in a different light than I... Some (especially German)
programmers think that similarity between programs' appearance can
confuse people. I wouldn't completely disagree with them.. Sometimes,
when using Mac, I've changed the program by accident - and as the menus
remained almost the same, as everything else too, it took me a while to
realize that this isn't "Mac Write" anymore. I think that could happen
to many people. You just activate the "wrong" window that belongs to
another, similar-looking program - things can easily get confusing.

Atari-programmers have standardized their programs a lot since the old
times. There are official guidelines for most features, including the
human interface. As a result, programs like Papyrus, look a lot like
Macintosh programs. The differences are slowly disappearing. I still
wouldn't change some unique user interfaces, like the ones of Calamus SL,
Arabesque, or DA's Picture. Sometimes a custom interface simply works
better than a standardized menu-driven interface. Keyboard shortcuts
should be standardized, I agree on that.

: The reason file selector replacements evolved on the Atari was because of the
: need to do stuff like format disks from within an application, to delete files
: to make room on a disk, and so on. The need arose because of the lack of
: multitasking on the early STs. Atari provided no way for to do any sort of
: file management from within applications. I really don't think most users
: open the file selector to save or open a file, see a file and suddenly think
: "Gee, I should delete that file!" or "Gee, I should really rename that file!"
: They either open the file selector to select a file, or they open it with
: the express purpose (if it's a replacement) of doing file management tasks.

I haven't yet known an Atari-user who doesn't just love UIS 3 or
Selectric... No matter, if one uses a multitasking OS, or not. Therefore,
there is more behind their success than just old flaws of early TOSes.
And speaking of those "Gee..." -type fellows, I'm one. As are many of my
friends, too. Your comments surprise me sometimes... But, I guess,
people learn different habits with different systems. What is natural for
an Atari user, may look ridiculous to a Mac-freak. And vice versa..

: Just because people prefer something doesn't mean it's better for them.
: Research allows us to PROVE that. Apple has done *extensive* research
: in the area of human interface design. They didn't just pluck their human
: interface out of thin air.

Let's suppose I developed a new soft drink. The research shows me that it's just perfect for average people. It's a perfect product.. And it sells well. But one day, there comes this troublemaker: a guy who doesn't want to buy my perfect product. I ask him: "This is the best choice for you, you know it - I know it. Why don't you buy it?". This guy just says: "It's too perfect. I don't like it because of that..." - and walks away.

This is a problem for computers like Mac. Some people out there just don't look for perfect solutions, but instead appreciate personality and some rough edges more. These are things one just can't explain rationally.. You like something - or you don't. It's often hard to tell, why. Mac may seem too "perfect" for surprisingly many people. It doesn't feel exciting, then - like some imperfect computer like Falcon, may feel. This is, at least, how I see it. Mac is nice, but Falcon is exciting... MacOS is complete and fine, but GEM with its rough edges just feels more right. This isn't rational reasoning: it's emotional. But we are emotional beings, after all..!

: But don't you see? If interface X allows a users to complete a task in ten
: seconds with an accuracy rate of 90%, and interface Y allows users to complete
: the same task in fifteen seconds with an accuracy rate of 70%, then isn't
: it self evident that interface X is superior?

Both Mac and Atari are known to be extremely efficient compared to PC-environment. They let people be more productive, make less errors. And so I agree with you. Can't say which one is really more efficient - but they both are good working environments.

Suddely one of my MEGA STEs (the one running ABK-BBS) won't run in 16 Mhz
As soon as I set the 16 MHz control-register the machine locks up completly.
Does anyone have any idea of what this could be (is there a chip to change) ?

We currently mainly work on a new Atari version of Papyrus which will
be ready in about one month. Give 2-3 month for the OS/2 version.

I agree that one of the ST's main shortcomings since its inception has
been the lack of standardized interface guidelines. Although as
others have pointed out - most new GEM programs use similar command
and interface structures.

However, a standardized interface does have its limitations. Sure, if
you're using a wordprocessor, spreadsheet, and database, a consistent
interface makes sense. But if you're using a programming language or
a really specialized application such as a bitmap graphics program an
alternate interface might make more sense. The designers of GUI's
can't possibly take into account every user's work style and/or
preferences so it may be possible that a standardized GUI might even
slow down or inconvenience a more experienced user.

Certainly, the best way is to make a compromise - use a standardized
interface but allow the user to re-conigure the program's command
access, etc. Alot of MS-DOS applications do this and I'm sure it hasn't
hurt that platform's longevity any.

>net access and keep signatures down to -4- lines as suggested by the Net
>Rules, OK?
I@> Surely it's the number of bytes not the number of lines that consumes
I@> bandwidth?

[annoying .sig deleted]
Yes, it is the number of bytes, but usually there is a reasonable relationship between # of bytes and # of lines. Either way, it IS a waste of space. I pay for my time online and if everyone had a 8 line sig attached to each 2 line message, then 80% of my costs would be spent on downloading sigs. Not really what I use the 'net for.

Moreso, as I have access via a BBS, and as such have to download ALL messages in all groups I read, and usually only 20% are of interest to me. I am sure I'm not the only one in this situation. So, yes have a little sig if you really want to, but a little consideration would be nice in keeping them down to 4 lines. If you take the argument to its extremes, then you could have everyone attaching a 250k GIF image of their house to the end of every mail.

I know that sounds stupid, but the principle is the same. Think of how many bytes your sig consumes worldwide ? How many systems have your message on them ? What sort of speed increase would there be if nobody used sigs ?

Anyway, I'm wasting bandwidth myself now, so I'll shut up.

Kev (sig free).

I think everyone is somewhat confused by what I mean by a standardised
interface. What I mean by standardised interface is that buttons all
act the same, the File and Edit menus have the standard items in the same
order, icons behave in the normal way, the program adheres to the principles
of feedback and direct manipulation, and so on.

I remember the program Calligrapher -- that program had an awful interface!
The menu items were spaced strangely, which made them hard to read. There
were so many menus that they filled the entire menu bar. There was a paint
toolbox in a menu! That's totally inappropriate; it makes painting difficult
if not impossible ... toolboxes should be in *windows*. The thing I remember
most was the way the icons behaved. If one icon was selected, and you clicked
and dragged on another icon, *both* icons would be moved. (Ie, the first
icons was not deselected when you clicked on the second icon.) This caused
me *no* end of frustration, since this was totally opposite to the way things
worked on the GEM Desktop!

What do you think makes GEM as easy to use as it is? The fact that windows
behave in the same way in every program, menu items highlight when you run
over them, scroll bars move when you click on them... the only reason these
interface items work the same way in every Atari program is because they're
hard-coded into GEM. Leave it up to the average Atari programmer, and they'd
have them all working differently in every program.

Just because the interface is standardised doesn't mean that programs can't
have different menus, different menu items, and so on. Standard interface
rules don't inhibit the user, they empower the user. When interface elements
act the way the user has come to expect, of course it makes the computer
easier to use -- for everyone, not just beginners!

>to many people. You just activate the "wrong" window that belongs to
>another, similar-looking program - things can easily get confusing.

Well, anyone who changes applications could notice that they're no longer
in Mac Write (or whichever application they're in) several ways: (1) The
mini icon in the upper right corner is changed to reflect the new application
you're in, (2) The menu bar has different items in it, (3) The windows that
is now active has different contents in it, and (4) When you decide to do
something with a menu, the menus items are different when you pull it down.

If you really want to, you can check off an option in the General Controls
control panel which allows you to automatically hide the desktop, and all
background applications. This prevents you from automatically switching
applications (it forces you to use the Application menu.)

As for German programmers, they're the ones who came up with that bizarre
Calamus interface... that's is incredibly hard to use. Who has time to
memorize what all those icons mean? It's exactly as difficult as having to
memorize CLI commands -- it's exactly what GUIs are meant to avoid!
Anyone who tries to differentiate his interface because he thinks otherwise
users will be confused when they switch applications is making a big mistake.
It's a *LOT* more confusing having to learn a new interface than looking at
a menu, realising you're in the wrong application, and switching back.

>Atari-programmers have standardized their programs a lot since the old
>times. There are official guidelines for most features, including the
>human interface.

I remember in the last issue of the Atari developer's newsletter which I got,
there was an article on interface guidelines. As a matter of fact, all it
mentioned was what items to put in the File and Edit menus in what order,
and what keyboard equivalents to use. Nothing else. The Apple Human Interface
Guidelines are extensive. It mentions windows, icons, menus, the mouse, the
keyboard, dialogue boxes, colour, language, principles of interface design,
design considerations ... you name it. And at each step, it explains WHY
Apple recommends you do things the way it suggests. It's 386 pages long.

>As a result, programs like Papyrus, look a lot like

>people learn different habits with different systems. What is natural for
>an Atari user, may look ridiculous to a Mac-freak. And vice versa..

Gee, thanks for the compliment. "Mac-freak?"
My point was that lists and buttons are not natural ways to manipulate files
in a graphical environment. (Take the Windows File Manager, for example.)

>Let's suppose I developed a new soft drink. The research shows me that
>it's just perfect for average people. It's a perfect product.. And it

>choice for you, you know it - I know it. Why don't you buy it?". This guy
>just says: "It's too perfect. I don't like it because of that..." - and
>walks away.

Your analogy is not correct. There is no way a soft drink can be objectively
measured to be better than another soft drink. You *can* however, use
objective measures to quantify the quality of user interfaces. Such things
as how long it takes users to complete tasks, how many users complete those
tasks correctly, and so on.

You are correct -- no interface is perfect. But just because there is no
perfect interface doesn't mean that some interfaces aren't better than others,
and that some ways of doing things aren't better than others.

>This is a problem for computers like Mac. Some people out there just
>don't look for perfect solutions, but instead appreciate personality and

>rationally.. You like something - or you don't. It's often hard to tell,
>why. Mac may seem too "perfect" for surprisingly many people. It doesn't
>feel exciting, then - like some imperfect computer like Falcon, may feel.

Wow. You're the first person *I've* ever talked to that thought the Mac
didn't have any personality!

A computer can have personality without having "rough edges." To me, rough
edges are things that are incomplete, things that were done wrong, things that
are difficult... the goal of any manufacturer should be to eliminate rough
edges from their products, but *not* to eliminate "personality."

Which is what exactly?

I used to say this all the time when I had my Atari, it's kinda a set-piece answer that people here have been using since 1985 (myself included)

Simply put the Mac does everything the ST does, and 10 times more. I can't think of a single thing that the ST does my Mac doesn't. Maybe it's been too long, can you give an example of this problem?

> different, freedom to format a floppy to 1.8 Mb instead of 1.44 - when I

But you can do all of this on the Mac.

> It feels clumsy. Do you believe that there exists some certain human
> interface that's ideal for everyone? Left-handed, logical, unlogical,
> people who like to write commands, people who prefer mouseclicks, ...?

No, but I do believe in the law of averages. The Mac has a LONG way to go (heck, perhaps Bob really *is* the future!), but the learning curve is still better.

Right. I remember it in the Mega's too, you could see some difference,
notably when GDOS was running, but not enough to make me get rid of my
non_GDOS boot disk.

> It was a big disappointment. Unlike the Amiga's Blitter, the STe's

Yes, the Amiga's blitter was a full processor, as it was in the former
Atari's. Of course, this was because it was designed by the same guy.

>(don't say it's yesterday too - because almost every computer becomes
>that very quickly ;-) is today, and even tomorrow for many ST/STE-owners.

If the TT is yesterday, the Falcon is too... I thought of buying a Falcon
but the 1040 style case, the 16 bit memory, the 16 MHz clock and the lack
of a decent standard bus prevented me from buying it. I am very happy with
my TT as it has fast memory, VME bus, seperate keyboard, built in
troublefree SCSI, standard FPU.
Since I have no need for 16 bit audio (the 8 bit in the TT is pretty good)
but do like speed, I think the TT is not dead yet. The only thing I miss is
the possibility to put in another processor like a 68040 or 68060.

Currently I'm running 800x600x256 @ 70 Hz on a home made VME-VGA adapter, in
contrary to the Falcon this doesn't hog up the processor bus...
Have you ever worked on a TT ?? With some fast-ram it just blows away the
Falcon in terms of raw speed.

A Falcon is fine for doing audio stuff and TV video animation but for pure
speed and expandability, I wouldn't swap my TT for a Falcon.
Try running MultiTOS on a Falcon.... Or even Linux....

This is certainly true, but I would have to guess that my experiences are more typical.

> That's absolutely false. I use MultiTOS (AES 4.1) a lot - and with that,
> I'm perfectly capable of using the file manager while working. I wonder,
> why so many people don't realize that Atari is capable of multitasking?

I am completely aware of this. And my 520ST, my friends 1040ST, the Mega's and the STe's that I saw did NOT do this out of the box. The Mac does. If you want to talk add ons, anyone can add whatever they want to anything.

The easy question is: Does any ST come out of the box pre-installed with a factory multi-tasking OS?

> Or if you don't like MTOS (4.1 is actually very good!), you can always
> use Geneva or MagiC! Two of those three use pre-emptive (real)
> multitasking method - unlike Windows 3.1 and MacOS, which only do
> co-operative multitasking / task-switching.

I used two of them (the later two). Neither was pre-emptive, has this changed?

> But... I use Selectric, even then. It's one of the greatest improvements
> for computers user-friendliness (and effectiveness) I've ever seen. All IMHO.

And if you want add ons, you can get boomerang for the Mac.

However, does the ST come with the Communications Toolbox or anything like it? The Dictonary Manager? TCP/IP built in? Multi-app scripting? Multi-language support in _all_ apps in a single line of text? Utils for handycapped users built in? 16.8 million colour support in all apps? Unified file formats in all apps? The equivalent of QuickTime built in?

How about apps? Got MS Word? Pagemaker? No, not clones, the real thing.

You see, the ST _could_ have come with all of this, and CERTAINLY _could_ have had it added in the last 10 years. But it didn't, and hasn't.

> It's not as simple and fast. Especially, if you have to select and get
> rid of many files.

At which point the user does what you do, buy and learn an add-on.

> those both a lot. And if a computer claims to be as easy to learn as Mac
> does - I shouldn't experience the problems I do?

I don't think so, but I use the same apps as you and do not see anything
of the sort. I'd have to assume there's something wrong with that Mac
that should be fixed.

> The problem with people like you

Uh oh, "people like me".

> is that you really *believe* that Mac is
> superior to other computers - and you just can't understand that someone
> isn't happy with it, without being a fool (or inexperienced, etc.).

Not at all, I was a happy ST user for 5 years. Now I am an even happier
Mac user for another 5.

> Therefore you approach me (ant the others) with this "I know more than
> you know, so don't argue!"

Oh hardly, not having touched a ST in 5 years I certainly don't even
pretend to be an expert.

> claims Mac isn't perfect. Even worse: some people think TOS is better..
> They can't be right - can they? Because Mac is a "superset" of Atari.

Well, yeah.

The ST is a great hackers machine, like a PC. However, to get it to do
what the Mac does out of the box is something that is beyond the ability
of the average computer user (who is simply baffled by Windows).

As far as I'm conserned, the most fun I've ever had with a computer was
with my old Atari 400! Now THAT was a hackers machine!

> Or is it? People like you like to tell the owners of "inferior
> computers" what the TRUTH is.

People like me again!

2329. Re: Installing MiNT and X windows

Newsgroup: comp.sys.atari.st
Date: 1995-05-07 00:00:00 UTC
From: dancer@nntp.brisnet.org.au
Message-ID: <1995May7.232430.30410@nntp.brisnet.org.au>
Source record: 166094

: For example there's MiNTnet, and the MiNTnet distribution is fairly
: OK in itself. But it tells you to get a nice MiNT setup, preferably
: MiNTOS. Now if you merge the /etc directories from MiNTOS and MiNTnet,
: it takes DAYS to find out which files belong to which, etc, and MONTHS
: to get a proper networking setup going.

I disagree. It took me approximately an hour, from the first time I downloaded
MiNTOS to have it installed. Another two hours with FTP, get me MiNTnet and
two hours after that I had the SLIP line running to my host, and doing things
direct. That was the first time. On the second, I _was_ irritated that
it took me time to _find_ things (I already knew exactly what I wanted,
originally, I started with the simplest set up, and got more MiNTnet aware
software from there) as they seem to be scattered over the german ftp sites
(which are incredibly hard to reach from here [3-20 CPS])

Yes, a better system should be cooked up, either an install script, or a
step-by-step installation guide. Tell you waht, I've got to install the whole
deal from scratch on someone's machine in a week or so, how about I write down
each of the steps, what another user would put in for their _own_ config,
and what sites and paths I use to request the files....Sound okay?

My processor runs at 32 Mhz with the FPU at 16 and i've never had any
problems. I'd love to get the FPU running faster but i've never found any
details on how to do this. i.e. Using the DSP clock .

Source record: 166098

Regarding the STe's enhanced sound capability...

Actually, yes, a number of programs - specifically digital tracker and .MOD players used the STe's digital sound capabilities as did a number of commercial and shareware games. The STe's digital sound features weren't cutting edge by any means but could at last best whatever sound capability the Amiga had. Each stereo channel could have its bass and treble adjusted and it could be mixed with the GI sound chip - all of this could be done with virtually no CPU time allowing the STe to play some pretty complex sounds along with interesting screen fx and animation, etc.

As for the Falcon...

Basically its a 16mhz 68030 machine in a 1040STe case. Its a hybrid - using 16bit bus access, 32bit internal access, and 24bit address line access. The Falcon has an incredibly powerful and flexible audio sub-system that sports 8 16bit digital channels and a DSP chip for signal manipulation. Graphically, the Falcon has built-in SVGA capabilities as well as 16bit (65,536) color support. Its video hardware can be re-programmed to support virtually any SVGA or XGA video mode. It also has an improved Blitter chip that runs at 16mhz. A very nice, albeit small Conner 85meg HD and a standard 1.44meg floppy are standard equipment. The Falcon has an IDE controller, a SCSI-II connector w/DMA, an Apple-talk compatible port, an its Serial hardware can support high speed communications.

All in all, the F030 is a nice piece of hardware with surprisingly good compatibility with older applications. It also has an internal expansion capability that allows it to *theoretically* connect all sorts of hardware emulators - I say thus because only a 286 emulator has come out!

The Falcon's main faults are its high price (it was originally priced around $1500 US w/o a monitor), its poor video performance (it compares quite favorably to a 386SX-20 PC running Windoze), and the handful of apps that exploited its full potential. I enjoyed the machine but I was relieved when I sold it (and that was no easy chore!).

To help those of you who want a comp.sys.atari.st.games newsgroup I have added a .games to the subject line so you can find this message. For those who don't you can kill any followups :)

Having failed miserably to get beyond Mission 4 in Cannon Fodder and about to swear never to waste any more time with it, I discovered an amazing, well written cheat program that makes it well worth while!

FTP.CNAM.FR:///pub/Atari/Games/cannon_fodder_cheat.prg.gz

With this frontend to your CF disks you can set infinite ammo and men, skip the nice but long winded intro, skip phases and select a mission. O what fun! Try driving the tank in TANKTASTIC or fly a helicopter in ROCKETMAN and GO FOR IT.

I can't stop my son playing even for ice cream!

2337. Flash garbled character problem

Newsgroup: comp.sys.atari.st
Date: 1995-05-08 00:00:00 UTC
From: balkcom@jhunix.hcf.jhu.edu
Message-ID: <3om3sd$aup@jhunix1.hcf.jhu.edu>
Source record: 165902

When I get large segments of text using flash and a 14.4k modem, it garbles the characters after about a screen-full worth of text and I start to get garbage. This does not happen with slower modems. In addition, after I get a certain amount of garbage, the modem hangs up and I have to reconnect. This is obviously a pain. Serial fix seems to do no good (including locking rts, cts). I have hsmodem installed now, which still allows the text to be mangled. However, with hsmodem, the modem doesn't hang up. Also, by setting the data receiving buffer larger with hsmodem (using the configure program), the amount of text I get before it gets mangled almost doubles. Still, when I get 3 or four pages of text scrolling by, I lose most of the information. (For example when I do a 'dir' command at an ftp site.) Does anybody have a fix for this? It doesn't seem to happen with the few other term programs I've tried, but they had other more serious problems. Can someone recommend a good free term program to me if no-one knows a fix for my problem? I like the GEM capture buffer in flash, the scripting language, and the function key macros, but this is really a pain.

Thanks!
-Devin

: : know what happened to it?
:
: I'd imagine that this along with thelikes of STOS pro, and various othr
: bits of software bit the dust within a few months of the falcons release.

Several pieces of software exist to do this. There is MoST which is Shareware, though I don't know where it can be downloaded from. This supports at least two CDs including a Movie Database, and a World Atlas type of thing. Then there is Sara which supports about twelve CDs, though I can't really remember which ones. I think there was a Wildlife CD, a couple of games CDs... I'm not sure if Sara is Shareware or Commercial. I believe that both Sara and MoST will work on anything from an ST to a Falcon030 to a Medusa. A version of Sara for Groliers Encyclopaedia was released at ACE'95.

I am informed that codehead have developed a front end for Microsoft Bookshelf.

True.

: > That's absolutely false. I use MultiTOS (AES 4.1) a lot - and with that,
: > I'm perfectly capable of using the file manager while working. I wonder,
: > why so many people don't realize that Atari is capable of multitasking?

: I am completely aware of this. And my 520ST, my friends 1040ST, the
: Mega's and the STe's that I saw did NOT do this out of the box. The Mac
: does. If you want to talk add ons, anyone can add whatever they want to
: anything.

: The easy question is: Does any ST come out of the box pre-installed with
: a factory multi-tasking OS?

The simple answer is: yes it does. MultiTOS comes with every Falcon.
And since ST is yesterday, the Falcon is everything we should think
about, now. Why speak of a computer of 1985..1990, that nobody
manufactures any longer?

: > Or if you don't like MTOS (4.1 is actually very good!), you can always
: > use Geneva or MagiC! Two of those three use pre-emptive (real)
: > multitasking method - unlike Windows 3.1 and MacOS, which only do
: > co-operative multitasking / task-switching.

: I used two of them (the later two). Neither was pre-emptive, has this
: changed?

Geneva is like MacOS and Win 3.1: co-operative. MultiTOS and MagiC are
pre-emptive both.

: > But... I use Selectric, even then. It's one of the greatest improvements
: > for computers user-friendliness (and effectiveness) I've ever seen. All IMHO.

: And if you want add ons, you can get boomerang for the Mac.

I'd like to see that. Is it a commercial program?

: However, does the ST come with the Communications Toolbox or anything
: like it? The Dictonary Manager? TCP/IP built in? Multi-app scripting?

: Multi-language support in _all_ apps in a single line of text? Utils for
: handycapped users built in? 16.8 million colour support in all apps?
: Unified file formats in all apps? The equivalent of QuickTime built in?

Atari is very much how you build it (I mean software). You get what you
want: fast MPEG decoders, comms programs, whatever. No, it all isn't
included into the basic package. For a beginner, Mac really is an easier
computer to use. But then again, not many Macs can do 16 bit hard disk
recording and DSP sound processing "out-of-the-box", can they? Falcon can.

: How about apps? Got MS Word? Pagemaker? No, not clones, the real thing.

You should ask: do I _want_ those programs? We have Papyrus (I love that
program, thanks R.O.M Software ;-), Calamus SL and Cubase Audio 2. Quite
as useful programs, though a bit different.

: I don't think so, but I use the same apps as you and do not see anything
: of the sort. I'd have to assume there's something wrong with that Mac
: that should be fixed.

I speak of about 40 Macs in 2 countries and 2 universities.. Different
models, different features. But, unfortunately, quite similar problems..

: > The problem with people like you

: Uh oh, "people like me".

Sorry, that was rude.

: > is that you really *believe* that Mac is
: > superior to other computers - and you just can't understand that someone
: > isn't happy with it, without being a fool (or inexperienced, etc.).

: Not at all, I was a happy ST user for 5 years. Now I am an even happier
: Mac user for another 5.

: > Therefore you approach me (ant the others) with this "I know more than
: > you know, so don't argue!"

: Oh hardly, not having touched a ST in 5 years I certainly don't even
: pretend to be an expert.

There's a difference, I think.. Because I use modern Macs almost daily,
though I can't claim to be any Mac-expert, either..

: The ST is a great hackers machine, like a PC. However, to get it to do
: what the Mac does out of the box is something that is beyond the ability
: of the average computer user (who is simply baffled by Windows).

I agree on that. Falcon requires lots of knowledge to work properly..

: As far as I'm conserned, the most fun I've ever had with a computer was
: with my old Atari 400! Now THAT was a hackers machine!

It's a pity I never owned one ;-) ...

AF> TOS 1.04 and was never fixed. Under MagiC, I have not seen a sign of
AF> this quirk.

I don't believe this is a problem if you're fastloading with PinHead, which
which by default clears 64k (or is it 32k?) of RAM for each program and ACC,
though you can adjust that for any/all. I've been fast ALL my programs and
ACCs for years with PinHead or Warp 9 and have had no apparent problems.

JR> The fastload bit works for ACCs as for normal programs.

It works, but Atari themselves have long recommended that you don't use it for ACCs because it can lead to unpredictable results. There is no problem with fastloading them with PinHead or Warp 9, though.

What in heaven's name is an EXE2 partition? Could it be that you have an
ext2 filesystem installed on partition 2?

> The Seagate has Minix partition 1, and EXE2 Swap partition 2.

The swappartition under Linux does not contain any filesystem. If it did,
there would be no problem with AHDI.

> Everything works fine as far a Linux goes, but when AHDI tries to
> boot the drives on powerup, I get 2 bombs after the Seagate is detected.

AHDI is brain-dead. Change the swap partition's partition ID (the arch/atari
section of NetBSD (sun-lamp) contains a small utility for this purpose).
At the same time, change the part. ID of partition 2 on the Quantum.

> 3. Is there any way to format a drive without using the ICD formatter?
> I don't see any way with AHDI to format a drive, unless I am missing
> part of the distribution.

Atari's formatter/partitioner is called HDX. Usually it's distributed
together with AHDI, you'll probably find it at a.a.u.e.

Tommi:

The Falcon might be able to format a High density disk to 1.8megs but
so what? MS-DOS can't even read extended format disk with out a
special device driver (thus, data exchange between the two platforms in
such a case goes out the window). Even more important - extended
disk formats - especially those that use extra tracks aren't very
safe. There's less data integrity associated with the inner-most
tracks of a disk. Sure, you might not encounter any problems with your
1.8meg disk now but eventually you will and when you least expect it.

Maury:

Things will certainly be different when Win95 ships but I highly doubt that
DOS will die. Unlike Windows, DOS runs on EVERY PC no matter what CPU.
There are tens of thousands of DOS apps out there and will be for some
time to come simply because its a standard and its easy to write for.
To quote an official at Software Publishing Corp. "They'll be DOS diehards
when we have Startrek technology".

You're right in saying that Windows will be THE operation environment
(may God help us all!) but DOS isn't going anywhere for a while (IBM is
about to release DOS 7.0 in fact).

Tommi:

I owned a Falcon for a while. I know what it could do and I also agree with
you that it was an impressive machine - on paper! It never really
impressed me as much as I originally thought. I had fun with it but
many of the applications and upgrades that I WANTED and NEEDED to make it
useful to me either never came out or came out too late for me.

Well, just my two cents...

Bite into a Slim-Jim and bite into a Cow's a**hole...

The system I have is a 520ST Upgraded to 1 meg.

I have both B&W and Color monitors along with
a Thomson color monitor.
The Thomson was very little.

2 disk drives. 1 SSSD and 1 DSDD

Lots of disks and software for it.

Best Offer.

John, I use Civilization on a Falcon and my nephew uses it on an ST, and
no patch is necessary. Mail off to Microprse for the disks with 07/14/93
on the datestamp.

Contact me at s.lyster@genie.geis.com if you'd like any further help.

I connect my Falcon to a Zyxel modem at 76800 bps without any problems
whatsoever. While my modem is V.32bis, 76800 is enough of an overspeed even
for the 28.8 kbps (V.34) modems. Not that the falcon isn't capable of higher
transfer rates: it's just that my modem can't talk any faster. :-)

If you are still concerned, get hsmoda06, which contains improved drivers
for the serial port. I don't find I really need them form my modem connects,
but I still user them because I feel they improve communication in iffy
situations (like when I'm moving windows while running Zmodem) and because
CoMa won't even talk to the modem unless hsmoda drivers are present.

> time---considering the loads of UNIX rubbish they spend their time
> porting on a daily basis)

I think the problem is that things are moving very fast. With MiNT and Linux/68 - Atari users have access to much more powerful systems than previously. When a new user is trying to install MiNT/Linux then of course they will be looking for the install FAQs that don't really exist. However once they *have* installed a working system - doing the documentation always seems to ge pushed back because:

a) There is something more interesting to play with (like porting some program).

b) The user feels the system is not 'finished' - so they decide to wait a bit more before documenting it.

As a user with both MiNT and Linux successfully installed - I know what it feels like from both ends - but documenting is still a tedious and boring thing to have to do. :-(

:-)

IU> like to add 2MB more to get full use of its capacity. Have some
IU> questions for anyone who has done the upgrade and knows what they're
IU> doing (or did):

Don't know this board. I assume that 16 RAM positions are filled and there
are 16 still vacant. The 16 on board will be connected as Bank 1 (using
RAS1, CAS1H and CAS1L) the 512Mb on the motherboard (if still connected)
will be configured as Bank 0. Any upgrade will need to use RAS0 etc. which
are currently used by the motherboard RAM.

IU> 1) Board was populated with Samsung(?) RAMchips (KM41C1000P-10).
IU> In obtaining extra RAM, do I need to get EXACTLY the same type of
IU> chips to fill the rest of the board, or areothers OK as long as I
IU> match the speed of the existing ones?

These are 1Mx1-bit chips with a speed rating of 100ns. You can expand using
ANY 1Mx1-bit chips with a speed lower than 120ns.

IU> Do Ineed to know anything
IU> about the limitations of the ST with regard to faster RAM chips?

Nope. Faster than 120ns will just cost you more - slower than 120ns may
fail.

IU> Can
IU> anyone direct me to distributors that carry these chips for a decent
IU> price?

I have recently been in the same position as you. The biggest prob. is
finding a distributor which stocks these as they are a bit out of date now.
They were used a lot in 286 PCs a lot of which are now being scrapped so if
I was you I would investigate the scrap market! I got 18 1Mbit
Siemens DRAMs for £21 from an advert in Micro Mart. You may get some joy
begging from your nearest PC repairer/upgrader or you could go to one of
these Computer Markets where traders sell defunct PC motherboards cheap and
extract the chips.

IU> 2) My unit has the original TOS 1.0. When I get around to upgrading
IU> this, are any more recent versions of TOS incompatible with the Z-
IU> RAM upgrade?

Nope. But you would be better off with TOS 1.04 anyway.

IU> 3) MMU is older CO25912-38, so I apparently do NOT have to replace it
IU> to accomodate all 4MB, right?

Ha! Same as mine, no probs.

IU> 4) Would appreciate additional tips anyone might have to make the
IU> upgrade a successful one. Thanks to all.

I'm afraid I don't know the ZRAM board but if there are positions for the extra 16 DRAMs you will probably find most of the work has already been done. There is a possibility that you MAY have to move the Bank 0 control lines from the motherboard to the expansion board - all depends what signals have been taken to the exp. board already.

Yell if I can be of any more help!

Roger

In the next few messages I'm going to be posting an article which originally appeared on the Atarinet and FidoST conferences. In it Mr. Rodney Rudd makes , among other wild claims, that Atari decided to pull the plug on their computer line back in 1989 and to slowly ease and squeeze out of the computer market over the next few years. He bases this on something Sam Tramiel told a writer for EDGE (and its American version, NEXT GENERATION).

His original article will appear in the next few posts, after which I will post my rebuttal to his article in which I will point out the problems I found with it.

I would really like to hear your comments on this issue - especially from Al Fasoldt, Hutch, Bob Brodie if he's here and from any Atari developers who are on this conference, as I feel that, being much closer to how the Atari markets have worked, as well as your own relationships with Atari Corporation, your observations may shed the light of truth on what is really going on in the market today vis a vis Atari's commitments to its computers, as well as the future of the whole platform.

Please feel free to correct me if I have been wrong or have been fuzzy in my rebuttal. Likewise do the same for Mr. Rudd's original article.

... I get into enough trouble without a tagline!

TRAMIEL ANNOUNCES THAT PROPRIETARY NON-INTEL COMPUTERS ARE
"IMPOSSIBLE"

Shocking Truth Revealed - Atari Decided To Pull The Plug Years Ago.

The speculation that Atari has left the personal home computer
business has
been rampant over the last year, having been bolstered by corporate
reports
and high level statements which all but spelled it out. Atari's
computer
marketing schemes have left Atari loyalists bewildered.

Part of the reason for the confusion among Atari computer
enthusiasts has been
due to the seemingly contradictory or vague comments made by
officials high in
Atari Corporation itself, perplexingly affirming Atari's commitment
to their
computers, while simultaneously expressing the finality of the
decision to
wash their hands of computers.
Atarians who have seen Atari's Falcon030 brochure had evidence that
Atari
appeared ready to push ahead with their ST compatible, but were
dismayed when
the usual Tramiel price war never materialized.
Now, with the April 1995 edition of NEXT GENERATION magazine comes
the real
honest-to-goodness bottom line on Atari's computer business,
straight from the
mouth of Sam Tramiel himself. NEXT GENERATION is a publication
devoted to
video game and entertainment technology. This month's issue looks
toward
Atari's past, present, and possible future. The exclusive interview
with Sam
Tramiel comes none too soon for devoted yet puzzled Atarians.

In addition to informing us that Atari is out of the computer business Mr.
Tramiel also shocks us (although no shock to savvy Atari watchers) that Atari
planned to scuttle their computer business years ago.

Sam Tramiel's confessions:

In 1989, Atari decided that the computer industry had become too cut-throat and that it was impossible to compete against the Microsoft/Intel juggernaut with a proprietary computer system.

We plan to concentrate all of our efforts on the entertainment electronics market. If we see a business opportunity for Atari we may decide to return to the computer business someday.

There you have it, in a nutshell. Atari essentially decided to pull the plug
on Atari computers in 1989.
And this is also the official word everyone was waiting for, because you
cannot "return someday" to a business that you no longer participate in.
These are not the sentiments of some industry pundit or scandal monger, this
comes right from Sam Tramiel himself.
With the revelation that Atari made a decision to halt production of their
computers way back in 1989, we must now surmise that the Falcon030 was simply
a product that was already "in the pipeline" and nearly ready to manufacture
in early 1990. The design work must have already been 99.9% complete. Did
Atari actually build the Falcon simply to recoup part of its earlier R&D
costs? Perhaps. As is their style, the Tramiels cleverly squeezed the last
ounce of profit out of a dying business. Many of us remember Atari doing
exactly the same with the Atari 8-bit line, when they released lower-cost XE
computers and sold them non-agressively for a few years before completely
halting production of them.
Atari is no longer a computer manufacturer, and the semi-commitment to "maybe"
return "someday" is about as tentative as anything Atari has ever said. Atari
saw the writing on the wall years before Commodore, which got the message too
late. Atari made a strictly by-the-numbers business decision to cut

their
losses and move on. It appears that Atari has spent the last four
years
winding down their computer division while ramping up the home game
operations. Tramiel watchers will be reminded that Jack Tramiel
purchased
both the computer and the home game divisions of Atari from Warner
Communications. Given Tramiel's track record at predicting consumer
demands,
the direction of Atari Corp now comes as no surprise. Jack Tramiel
made his
first really significant fortune manufacturing Commodore desktop
calculators,
switching suddenly to home computers when that market was barely
outside its
infancy. After making Commodore a billion dollar a year business,
he bought
Atari. Naturally, Atari Corp is a product of Tramiel's vision,
which is
simply: go where mass market consumer electronics is and sell as
much as you
can before the market burns itself out. ...continues in next
message...

2359. The Shocking Truth #2

Newsgroup: comp.sys.atari.st
Date: 1995-05-08 00:00:00 UTC
From: Dan.Dreibelbis@tor250.org
Message-ID: <368_9505091258@tor250.org>
Source record: 165924

From: RODNEY RUDD Msg: 13812
To: DAN DREIBELBIS Date: 04-29-95
Topic: Truth revealed -Part2 Area: Fido Atari ST |28
BBS: Balmy Beach BBS [(416)690-9641]

Now, let's address why Atari Corp officials have been so vague as to the final
dispostion of the ST computer line. Obviously, Atari wanted to avoid a public
relations nightmare as they re-entered the home console market. The last
thing Atari wanted was angry ST/TT/Falcon owners out there throwing angry
comments into the faces of console retailers. For this reason, Atari officials
have couched their comments in gentle euphemisms, gingerly skirting the issue.
Rather than coming right out and saying "look, Atari computers are dead - get
over it" Atari officials inform us that "we're concentrating on the Jaguar
right now." Has Atari Corp been telling us lies? Well, not lately. Upon
examination of official Atari Corp comments, we find that the truth was there
all along, just cleverly hidden from casual view.

In fact, looking at the statements of other Atari officials, one finds that
their comments don't really contradict what Sam Tramiel has said. The most
incongruous statements, such as those made by James Grunke, become perfectly
clear when examined in context with what Tramiel has stated.

When Grunke said...

"The Falcon is still being manufactured and as long as the
market continues to exist, we will continue to provide it".

he may have been perfectly honest - the Falcon is still in production, it just
isn't the Atari Falcon, it's the C-Lab Falcon. Also notice the disclaimer "as

long as the market continues to exist." Well, as already noted by Tramiel,
Atari decided that the mass-market proprietary computer market didn't (or
couldn't) exist back in 1989.
And "we will... provide it" can simply refer to Atari's generous willingness
to license TOS and the Falcon custom chip designs to 3rd parties (something
Atari refused to do with the Atari 130XE operating system and schematics).

Grunke's further comments also align perfectly with the intent of his superior's statements:
"Atari is a technology company. Right now, our main focus is the Jaguar."

Notice that Grunke carefully avoids saying that Atari is a "computer" company.
What Grunke says is correct, Atari is in the technology business, and as
specifically expressed by Mr. Tramiel, Atari is a mass-market technology
company which has no interest in supplying small niche markets.

Grunke then confirms this in his next sentence where he says:

"The Falcon has become a niche market computer and Atari is a consumer electronics company set up to service the mass market. As such we feel that the Jaguar has the greatest opportunity to meet our business goals."

Here, Grunke is doing his job as a diplomat, telling you your throat was just
cut in a very nice, gentle manner. Atari's vision is that of a mass marketer,
and Atari has capitulated to the knowledge that the Falcon is a niche market
product - hence Atari had to divest itself.
In truth, Atari's decision to divest itself of the computer market occured in
1989, and in winding down their computer business, the market naturally
reverted to the state of a niche market. In essense, Mr. Grunke is simply
declaring to us the results of the self-fullfilling prophecy put in motion in
1989.
The reality of the Atari Falcon030 is that it is a latter-day Atari 130XE.
What I mean by that is that it holds the same position as the final production

model of a computer line being phased out. Now we know, thanks to
the
revelations of Sam Tramiel himself, that Atari never intended to go
to bat for
the survival of the Falcon - the life support had been removed by
the doctor
even before it went on sale. It was put on the market for no reason
other than
to sop up what remaining gravy there was on the Atari computer plate.

Finally, we understand why the usual trademark Tramiel price slashes
never
occurred - they never produced the Falcon to survive in the mass
market. Atari
made only enough of them to supply the few remaining MIDI/Audio
Atari diehards
out there, charging them what the market would bear. As usual, the
Tramiel's
ability to see the writing on the wall before it becomes too late
(as in the
case of Commodore) is uncanny. Most Atarians would like to believe
the myth
that the Tramiels are blithering dolts, but once again we see the
wool pulled
securely down around our own eyes, not theirs. They know exactly
what they
are doing, and I suspect they always have.-end-

The Shocking Truth about THE SHOCKING TRUTH:
A Critique from an Atarian in the trenches

After reading Rodney Rudd's opinion (and remember, it's nothing more than his opinion) that Atari Corporation decided to pull the plug on their computers back in 1989, and in the process supposedly hosed the entire user and developer base with a grand conspiracy to squeeze every dime out of them before "plunging the knife in their backs", I couldn't help but notice that there were major holes in his hypothesis. VERY major holes. Holes that his excellent writing style and use of grammar just couldn't cover up.

Somebody had to expose those holes before Mr. Rudd's mistakes became gospel. Somebody had to put his foot down. That foot is me.

Before I begin, let me note that I in no way consider myself an expert in the computer market and how it operates. As a retail salesman in the hardware/housewares market for the past ten years, however, I feel I have a good grasp of the economics of how to (and how >not< to) run a business in the regards of how to treat your customers, which directions to go for current and future sales,trying to figure out what the customer wants and needs, etc.

>Sam Tramiel's confessions:
>
> In 1989, Atari decided that the computer industry had become too
> cut-throat and that it was impossible to compete against the

>
>There you have it, in a nutshell. Atari essentially decided to
>pull the plug on Atari computers in 1989.... These are not the
>sentiments of some industry pundit or scandal monger, this comes
>right from Sam Tramiel himself.

First, remember who this "official" pronouncement is coming from - Sam Tramiel himself. Mr. Tramiel is well-known amongst most Atarians for the ability to make the bold sweeping statement for the press to make the greatest possible immediate impact, but which ultimately is proven to be bluster. Think on it - this is the same Sam Tramiel who told the press in 1991 that the ST Pad

handwriting-recognition computer would be produced within months of its showing (it never was),or who told Jaguar owners that they could expect to have over 30 new games available for their system before Christmas 1994 (they didn't). And how about the major ad campaigns for that were promised for the Lynx, for the Falcon, for a variety of different Atari products - ad campaigns that never materialized? Huh? If Mr. Tramiel cannot make a statement and have it follow through like the above, then WHY TRUST HIM NOW WITH THIS STATEMENT?

Think I'm going off the deep end with this thread? Well, think on this. It's 1989. The Tramiels decided to drop the propriety computer line because it's not profitable and go into another line that would be; and they plan to slowly get rid of all their existing stock to the public before killing it off altogether. Okay. Then, pray tell, if they had so little faith in the computer line, as Mr. Rudd alleges, then kindly explain THIS chain of events:

1990: Atari releases 1040 STe series, an enhanced version of the ST series with stereo digital sound, added joystick ports, hardware vertical scrolling, improved colour palate. Uses a slightly revised version of TOS (1.6, later 1.62). New motherboard (that allows for SIMM memory upgrading), modified case.

1991: Atari TT030 released, an all-new Atari designed around the 32 mHz Motorola 68030 chip, with an internal hard drive, 1.44 disk drive, and SCSI and LAN ports, in a radical (and to some, controversial), case with separate keyboard. Even better, it has a new redesigned version of TOS (3.06) that allows for keyboard shortcuts, launching programs via icons on desktops.

Also 1991: Atari releases Mega STe - this fits between the STe line and the TT030; in the same case as the TT, it features a 16mHz 68000 chip, as well as an operating system similar to the TT's (2.05, later 2.06) as well as the internal hard drive and, on later models, a 1.44 disk drive.

ALSO 1991: Atari releases new versions of their monitors, the SC1435 (colour) and SM147 (monochrome). The former is remarkable because it has built-in stereo sound and is much brighter; it is in fact a rebadged Phillips monitor that is popular in Europe for the ST and Amiga. The latter is a 14" "paper-white" mono monitor which allows for a much larger screen than its predecessors.

AGAIN, 1991: Atari releases the SLM 605, the newest version of their laser printer. Based around an Epson design, it's smaller, sleeker, and easier to get toner and parts for.

October 1991: Atari appears at the Canadian Computer Show in Toronto, showing off the MegaSTe, the TT030, and the SC1435 monitor, as well as other Atari products, to consumers and the press in a huge booth that must have set them back some money. Also at the

booth - the new MegaFile 44 cartridge-based ACSI hard drive system

1992: Atari releases, albeit in small quantities, the ST BOOK, a laptop computer based around a slightly modified TOS 2.06.

April 1992: Atari shows off, to dealers and developers alike in a hush-hush manner, the first prototype of the Falcon 030 (a 16mHz 68030 machine with an added DSP, conventional SCSI and video ports, and digital sound recording capabilities) at the Toronto ACE '92 show/convention put on by the Toronto Atari Federation user group (the show is financed in part by Atari Canada). A beta of MultiTOS (their new multitasking operating system) is running at Atari's booth at the same show.

Summer 1992: Atari starts shipping out development machines to the Atari developers. Also hires developers to design software that would take advantage of the Falcon's power to be bundled with the hard-drive model (like the SAM audio playback program, and Atari Works).

Late 1992: Atari hires Eric Smith (author of MiNT, the kernal which allows .TTP and .TOS programs to multi-task) to help tighten up the release of MultiTOS along with the Falcon.

Also late 1992: Atari begins closing down some of its offices in other countries: most notably Atari Canada, that although sold more ST systems in Canada than the US office did in the US (partially due to the fact that they actually did some advertising), was one of their biggest money-losing subsidiaries.

November 1992: TAF meeting has DMC Publishing as its guest; they bring along their development Falcon 030 to the meeting for the members to look at and ask questions about.

Early 1993: Falcon 030 released in Europe, presumably to allow the German hackers to get a head-start at actually developing some unique software for the machine before it's released to the rest of the world. Also BYTE magazine does an article on the Falcon, noting its revolutionary features for a computer of its price range.

April 1993: Falcon 030 released in US.

June 1993: Falcon 030 released in Canada

Summer 1993 - Jaguar game system announced at summer CES in Las Vegas.

Winter 1993 - Sam Tramiel says to ST Format magazine that they're looking at the possibility of developing a Jaguar-based computer. Jaguar starts appearing in its test markets.

Early 1994 - Atari suspends computer development department, placing personnel into Jaguar development.

Does something seem wrong here? Why would, if Atari didn't
believe in their computers back in 1989, release majorly enhanced
versions of their propriety design (which required things like
redesigned motherboards and redesigned or modified cases) and
entirely revamped machines over the next five years? Why did it take
five years to close down their computer development labs, both in
Sunnyvale and in Texas? Why did they spend money in 1991 and 1992 to
promote and develop for something they allegedly didn't
believe in? Why would they even bother releasing computers into the
North American market, a market where Atari had always done the
poorest? Wouldn't be just easier to just cut all lines and slowly,
gradually sell off what stock they had left? Think on it. Atari
must've had an awfully big warehouse to stockpile all that stuff
they had in 1989 :)

>"And this is also the official word everyone was waiting for,
>because you cannot "return someday" to a business that you no
>longer participate in."

Sure you can. Just because something is not profitable in the
current time frame for your business that you decide to abandon it
doesn't mean that one should entirely discount the possibility of
returning to it should a profit through a unique niche in that
market that your company can exploit comes forth. ("A wise man can
hear profit in the wind"- Ferengi Rule of Acquisition #22)

Mr. Rudd should try to tell Lamborghini that they shouldn't have
returned to the automobile market in the 1960s after originally
abandoning it in 1948 to pursue the more lucrative tractor and
heating equipment market. Or told Warner Brothers it was folly to
re-enter the animated cartoon market after closing down their
animation studio in 1963. Or told Peavey Electronics they were being
foolish in 1985 when they came out withtheir first all-tube
instrument amplifiers since they abandoned that market in the early
1970s (and I'm sure that Hartley Peavey, a level-headed businessman,
could well give Rodney an earful on how to run a business and
how to spot a good market a company of their type can enter into
lucratively). Hey, he'd be rather surprised about CF Martin ,
makers of fine acoustic guitars, who entered the electric guitar
market, abandoned it, and then returned - not once, but SEVERAL
times. Come to think of it, didn't Atari themselves abandon the home
game console market around 1990, ONLY TO RETURN TO IT AGAIN WITH THE
JAGUAR IN 1993?

Say what you will about the Tramiels - they may be the worst
marketers in the world, but when coming to recognizing a market that
they can get into for possible profit, and coming through with a
product that can take a good shot at that market, they rival, and in
some ways surpass, the best companies out. I have no doubts that if
they find some way to re-enter the computer market with a unique
angle (even if they have to do it with an >ugh< Intel-based
machine), they'll do it. I would never bet against the

Tramiels, or Richard Nixon when he was alive, for making spectacular comebacks after everyone had written them off.

>"With the revelation that Atari made a decision to halt production
>of their computers way back in 1989, we must now surmise that the
>Falcon030 was simply a product that was already "in the pipeline"
>and nearly ready to manufacture in early 1990. The design work
>must have already been 99.9% complete. Did Atari actually build
>the Falcon simply to recoup part of its earlier R&D costs?
>Perhaps."

Perhaps not. Again, look at the timeline! Atari didn't show the prototype to dealers and developers until 1992, and didn't send out development machines until later that summer. The first inklings of it in R&D could well have been made in 1990, but NOT as far as "99.9% complete". And if it were "nearly ready to manufacture" in 1990, then WHY THE H-E-DOUBLE HOCKEY STICKS DID THEY EVEN BOTHER RELEASING THE TT030, WHICH CAME OUT IN 1991, WHEN THEY HAD A REVOLUTIONARY COMPUTER THAT COULD POTENTIALLY SELL AT AROUND THE SAME PRICE? I highly doubt that the Tramiels would be so stupid as not to release a potentially incredible computer that had many of the same features the NeXT (the DSP, digital audio recording, enhanced colour palate) was offering at an even better price. Even better, what with the revolving door policy Atari had regarding their employees during this period, as well as the propensity of the Tramiels for bragging about what they had cooking in the R&D department before it was even released during this time period, HOW COULD THE FALCON HAVE REMAINED A SECRET FOR SO LONG?

>"Atari is no longer a computer manufacturer, and the
>semi-commitment to "maybe" return "someday" is about as tentative
>as anything Atari has ever said. Atari saw the writing on the wall
>years before Commodore, which got the message too late."

Firstly, it's a little presumptuous to say that Atari doesn't manufacture computers anymore going on what we have seen so far. How does Mr. Rudd know, for instance, about what the market is still like in Europe, which although it has shrunk, is still Atari's biggest market for their computers? What about Eastern Europe and

F > were acid tests for PC compatibility.

Finally, an answer!

So it failed because it wasn't totally PC compatible and
expensive to produce, eh? Would've then made a very costly fiasco
for Atari if they had hypothetically used that as their launch into
the hi-powered computer market instead of the ST. Which is why we
hear more about the ST line than the Mindset these days.

I guess this will shut Mr. Sheppard up now - or at least makes
him make sure he gets his "facts" straight before he wibbles on
about nothing in this conference again :) .

Thanks for posting that info.

>Did you format your boot partition less than 16 or 32 meg?

This is not necessary, my boot partition is 100 Mb...

I use the Hushi SCSI tools (5.x) and they are considered very good, my DEC RZ28 SCSI drive does not start it's spindle motor unless it is told to do so (which the TT does not..). Result is that I can't boot from this drive, it also has the nasty habit of always being SCSI ID0... With Hushi however it is possible to boot up from the second drive (ID1) which starts up the first (ID0) and then run stuff from the first drive, my C partition is on the DEC and is 50 Mb, the boot partition 'I' is on the Quantum and is 100 Mb, no problem...

It was none other than Spencer Davies who did write on 04 May 95 that ....
GI>> os/2 is almost a bad ..but also as dead in the water as TOS as far
GI>> as user base is concerned ..despite a MASSIVE ad campaign and at
GI>> least a 6 month lead over the Microsoft offering it is a complete
GI>> non event
SD> Oh, I wouldn't go that far Graham. I have OS/2, Windows95 and Windows

Of course you are an Atarian so you make the best desicion ..the Contemptible world in general does not know a good thing if it walked up to it and slapped it on the face and in %age terms the position of o/s2 is very very small.

GI>> Microsofts own programs that exists with this resource regularly
GI>> brings the system crashing around your precious data.
SD> I've not had any PC's crashing due to the GDI limit. Just cases of
SD> PC's with 16 or 32Mb of RAM running out of memory (even though they
SD> show the machine to have at least 60% of that memory free!)

Thats is the problem and my hunch on that is this the due to the flaw in the GDI.

GI>> TOS,MINTOS,LINUX,0S9,OMEN,MAGIC (okay not strictly an alternative
GI>> but as much as Windows is to DOS),MROS,That cartridge port
GI>> multitasking system (Can't remember its name now), bound to be loads
GI>> more I haven't come across.
SD> Was SMS2 the one on a cartridge you was thinking about?
yes , I think you are the only user are you not :-)

SD> The one big problem is that none of these systems are ideal IMHO, but
SD> then again what would you class as ideal? Windows or System 7 are NOT
SD> it!

TOS/GEM (or perhaps MAgiC even)is the best stand alone system (IMHO!) by far , its clean, stable and does not impose unneccessarily overheads on the hardware.

Add the requirement's of networks and multitasking and its open season on headache land , Atari users don't have a system and PC/Mac users don't have a good one... not sure which is the better off there :-) . Magic (when the Falcon version IS released) might be worth something but only if it supports device drivers and MinT. Otherwise I am looking to MinA to add to my increasing interest in MinT-OS as a possible future O/S config for my Falcon .

2368. [Q] EB ED POV: Not showing CSGs

Newsgroup: comp.sys.atari.st
Date: 1995-05-08 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <3okngf$eba@status.gen.nz>
Source record: 166010

I have just downloaded EB ED POV revision 1.84d.

I have figured out how to create objects, make them appear in the view window, and all the obvious, basic things.

However, I am having a few problems. The cause of the problems might be simply that I cannot understand french. Anyhow, these are the problems:

1. When I create a couple of objects, and then make a CSG out of them, the objects still appear as two seperate objects, which can be moved around independantly of each other. When I create a CSG Difference, for example, I can still see the whole objects as though nothing had happened to them. When I go to the "Modify Objects" dialogue, where you can set size rotation colour etc. I can see the CSG object listed, but the the original objects which should now be components of the CSG are still listed. What am I doing wrong? Is it a bug in EB ED POV? Is it a limitation of EB ED POV?

2. I cannot load any of the example scenes. I get an error saying that the file is not of the correct type for this operation. What is the problem?

3. What do the options "Fond gris", "Ecran Virtuel", "Sauveguarde" and "TLS/RVB" in the Divers > Parametrages dialogue do?

4. I have worked out that ARB2EBS.PRG is used to convert .INC files into .EBS files. Can I use this to convert for example SHAPES2.INC into an EBS file? I tried to, with all the different options I could find, but it did not work too well. If it can convert INC files (which contain objects), can I convert .POV files also? I have built up a lot of POV files which I would like to convert. If I cannot convert .POV files, is there another application available which will allow me to do this?

5. Does the author have an email address? Are there docs available anywhere (preferrably in English or German)?

Thanks for reading this long document, and thanks for any help. It is much appreciated!

Did you format your boot partition less than 16 or 32 meg?

And unless you use software to change the setting of Falcon, you have to
wait for a long time to boot from SCSI.

I've had the "16 mhz blues" in two flavours:

1. The socketted chips had become a little loose. Pressed them back.

2. The CPU gets tooo hot after approx 4 hours of use. Glued some extra
metal arrangement (what I found in the kitchen) on top.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello all,

1) Some people have been mentioning an HSMODEM driver for MiNT (so that MiNT uses the HSMOD routines instead of its own) - where can I find this?? (I tried looking in many archive sites and archie also turned up with nothing)

2) I'm curious about TT video cards - is it possible to switch off the TT inernal video (so as to speed up the bus for the CPU?) IF I get a video card with VRAM, I assume then the TT video can be off and the video should then be very fast since the video card should not really tie up the bus on a regular basis - is this how most video cards are set up? I assume a DRAM video card + TT video would be a real bus hog. Anybody know for sure or have any specs?

Thanks,
Sam

>RAM. :-) BTW: The Mega does have the cart. port does it not?
Yes, the Mega has a cartrige port. The difference to the old 1040 is that
the FM-modulator is missing and that the mega has an additional Blitter unit.

Cheers
Folki

15.000 is at least the number of Falcon owners in Germany alone. Just look at the many ads in ST Computer alone.

Even at the Elmshorner Atari Messe in obtober 1994, 70 % of all machines represented there were Falcon's. Well most of them was enhanced in one or another way.

The remaining 30 % were TT's, Clones and ST's, were the ST's were the minority. Most Atari-users in Germany have upgraded in some way.

MagiC 3.0 (without Ease) comes with Magxdesk 2.5 which actually
is a newer version of Kaosdesk.
Magxdesk 3.0 (with colour icons, alias support, background file
operations, icon assignment program etc.) is being "alpha" tested
and will come with the UK version of MagiC 3.

Has anyone working up the MiNT distributions (who has a TT) ever tried to
set up Linux? I only had to pull down 5 files for a basic setup: the atari
bootstrap, atari kernel, ram disk file system, root.tar.gz, and usr.tar.gz.
With the exception of the usr.tar.gz (~6 megs), root.tgz was the largest file
at 700K. Intallation was done in less than 2 hours (most of the time going
to decompresing the usr.tgz file. Easy to follow instructions are available
with only minor tweeking for the Atari (this is where Unix/MiNT experience
pays off, but if you don't have Unix/MiNT/Linux experience, why install Linux
to begin with?).

My point of this is that we should just get a basic setup on the Net for
Mint. Say a zoo/lzh file of a C:\mint directory with all the drivers for
minix, mintnet, configurations and the minix binary distribution; plus the
Mint program in the autofolder (maybe provide some folder sort program for
the user to sort the autofolder). Also needed would be decompression tools

NOTE: the mint.cnf would need to be configured to go to GEM after a boot.

Have them reboot and run minix on their partition. Decompress another file
onto the Minix partition which has ALL the basic system programs they would

need (NO SOURES). In the Linux case this included programs like telnet,ftp, and the like. Mintnet configurations would be included which set up loopbacks and all that, with a sample hostname.

Another mint.cnf file would be needed at this point to start a shell instead of GEM, and all the rc* files.

Then the user could then customize files to tailor the system.

Now, this is off the top of my head, please feel free to use any part of it and work out details I might have missed.

> --Gerry

Oh, I agree completely... I just think things could have been done a LOT better than they were, and that the Atari computer platform could have become an "alternate" to the IBM, similar to what Macintosh has been, but at a lower price point.

Back when the IBM PC, the Amiga 500 and the Atari 520ST were brand new, the playing field was a lot more level (of course, the PC had the IBM name behind it, which was probably an insurmountable advantage over the other two).

I just wish the Atari computer, which was always a good design, and a good value, had been marketed more aggressively, had been advertised and promoted, and had been upgraded on a timely basis.

It's fun to "day dream" and imagine where we'd be if someone else had been running the company...

> I thought that the GEMulator card did the same as the Janus card - ie. it
> had an on-board 68000 (the Janus has a 16MHz 68000 on the card).

Nope... all the GEMulator has on it is sockets for the TOS ROMs. It does
its emulation in software, just like pc-ditto did.

That's why the Janus card can achieve such higher emulation speeds than the
GEMulator on a slower PC.

It's also why the GEMulator is less expensive than the Janus...

BobR

(Actually, I have a GEMulator coming in the mail this week, so I'll be able
to post from actual first-hand experience soon, instead of what I've read
in the BRAsoft newsletter...)

This is because the Mac has a truly horrible interface for telling you what program is running - a tiny icon in the upper right of the screen.

However, this is hardly and argument against standards - in fact it seems like a great argument FOR it!

> Atari-programmers have standardized their programs a lot since the old

Absolutely!

> The designers of GUI's
> can't possibly take into account every user's work style and/or
> preferences so it may be possible that a standardized GUI might even
> slow down or inconvenience a more experienced user.

They don't pretend to. In fact, the Apple Human Interface Guidelines
goes into great detail on how to extend the "standards" when they don't
work or don't exist.

Basically, it's a set of guidelines...

a) objects are concrete items, treat them as such
b) always let the user back out of an operation cleanly
c) modes confuse people, try to keep as few modes as possible
d) things that do the same thing should look, and operate,
in similar ways. Items that do different things should look
and operate in different ways.
e) if your program does something radically different, it should
look radically different
f) test test test!!!

So even when inventing a BRAND new program, you at least have something
to go on. The results do shine!

> access, etc. Alot of MS-DOS applications do this and I'm sure it hasn't
> hurt that platform's longevity any.

It would seem to me that when Win95 ships, DOS is dead.

: I've seen 1.6.

That explains me a lot of your comments on TOS... =-(Too few of you have ever used even TT-TOS, not to mention hugely improved Falcon-TOS 4.x.. You wouldn't want to use some old Mac Finder, when you've used to System 7, would you? TOS 1.6 works, but otherwise it's history. The difference between TOS 1.0/1.2 and 1.4/1.6x is that the latter work (without much special features), and the former hardly work in today's standards. We might as well talk about Windows 2, or DOS 2.x..

: > would be - just an enhanced version. The later Falcon 030 (which I would
: > later own) was what the STe should have been.

: And the Falcon? They never made it to Canada, so I didn't see much of them.

The most some people know about Falcon is this: it looks like a STE, and it's supposed to be far-too-slow to be useful (68030/16 MHz).

If you judge Falcon as an "improved STE", it really doesn't impress anyone. But if I told you the following:

- Dramatically improved desktop and OS (e.g. networking capabilities, very nice new 3-D look of GEM, color icons, fully customizable desktop and keyboard shortcuts, etc..)

- DSP digital signal processor, capable of recording, playing and handling in real time 16 bit 50 kHz stereo sound in 8 channels simultaneously. It's fairly easy and inexpensive to change your Falcon into a fully professional, digital recording studio. That's why C-Lab continues Falcon's manufacturing and developement: F-030 is an excellent music computer with perhaps unrivalled possibilities. Macs are good at that, too - but with the same capabilities, they cost much more.

- LAN port (AppleTalk-compatible), 115 bps serial port, 2-direction Centronics, DSP-port (for external hardware), SVGA/RGB/RF video outputs, 2 digital and 2 analog controller ports, modul port, internal 030 bus connector (for e.g. 68040 accelerators - Barracuda 040 accelerator e.g.

uses this), SCSI-2 and IDE ports, MIDI in/out, etc.

A socket for 68882 math co-processor 16..50 MHz

- Very versatile video system. Freely programmable, from 15.25 kHz (CGA and television/RGB) up to about 70 kHz. Video clock 25/32 MHz internal, and externally up to 70 MHz. Colors 2..65.000, non-interlaced or interlaced. Resolutions 320x200..1280x1024 (depending on display device used, and video clock frequency), GENLOCK-capability and external sync can be used, if needed. Overscan-capability.

- IDE/SCSI-2 ports allow one to use virtually all PC/Mac-devices, like CD-ROMs, streamers, scanners, etc. on Falcon.

- Memory can be upgraded to over 128 Mb, using a Fast-RAM card.

And so on.

In fact, Falcon only looks like a STE; it is a completely different computer. As you could see, its feature list is quite impressive compared to many computers: DSP, all ports one might need (well, nearly..), you can connect it to anything from TV to SVGA Multisync, and use it as a fully professional digital studio. The operating system in very nice, I think. I love to use it - and although Falcon may be a bit slow sometimes, it is a very usable computer even without accelerator board. When people speak of "slow", it doesn't mean the same as with Windows: one doesn't have to wait for menus to drop, wait for screen updates, etc. Most things happen quite fast on Falcon. The Blitter co-processor helps somewhat with this. What isn't fast, is pure calculating. I wouldn't use Falcon for large spreadsheets - at least, unaccelerated...
It's a very nice computer, and fun to use. At least, mostly..

I hope you won't judge the whole Atari scene after old ST- and STE models. We don't speak much about Mac Plus either, do we ;-) ?

: Maury

Cheers,

Tommi

: > Macintosh is a structured working environment; the programs look pretty
: > similar, and everything has been strongly standardized. Although I find
: > this good for beginners (Mac is easier to learn than Atari),

: > I miss the freedom Atari-environment gives me.

: Which is what exactly?

It isn't that easy to explain, you know... Can you tell me, why some car
feels better to drive than another? And one feature that makes you enjoy
the car, may annoy another driver. It's personal..

: I used to say this all the time when I had my Atari, it's kinda a
: set-piece answer that people here have been using since 1985 (myself
: included)

: Simply put the Mac does everything the ST does, and 10 times more. I
: can't think of a single thing that the ST does my Mac doesn't. Maybe it's
: been too long, can you give an example of this problem?

Well... I've worked with a TT system with 36 Mb of RAM, 24-bit graphics,
using Calamus SL for professional id-card manufacturing. A great deal of
work we did, was handling huge 24-bit digitized pictures (typically 2 Mb
each), 12 pictures per one Calamus page. And the result was printed with
a SCSI full-color sublimation printer, on plastic. We could have done
this with PC or Mac. It was done on PC earlier.. But after all, TT and
Calamus did the job by far fastest. It did a better job than 486s, or
Mac Quadras we also used. And you can believe that this firm _would_
have used something else, if something else had worked better! In
Finland, Atari isn't exactly the "dream computer" for firms; people use
PCs and Macs, as they are cheaper and more easily available.

So, I can't tell you "why" Atari-environment feels better to me; it just
does. It makes me work more efficiently, gives me more results in certain
time. TOS seems to work the way I myself think. Unfortunately, most
other operating systems don't. You have to use professional Atari
systems yourself, to see what I mean.

: > different, freedom to format a floppy to 1.8 Mb instead of 1.44 - when I
: > need more space, freedom to choose between many completely different
: > desktops, etc.

: But you can do all of this on the Mac.

Format a DOS-floppy as 1.8 Mb..? I doubt that very much. If I feed Mac with anything but 100% standard IBM 1.44 Mb, it either won't recognize the disk and offers to format it again - or locks up =-(. And this isn't my imagination, but reality.

: No, but I do believe in the law of averages. The Mac has a LONG way to
: go (heck, perhaps Bob really *is* the future!), but the learning curve is
: still better.

Who knows, maybe it is. And let Great Pumpkin save us from things like Bob ;-) !

2397. Xformer cable

Newsgroup: comp.sys.atari.st
Date: 1995-05-08 00:00:00 UTC
From: bh@okcforum.osrhe.edu
Message-ID: <3olmmb$sgg@romulus.ucs.uoknor.edu>
Source record: 166039

>followel@ix.netcom.com (Byron Followell), asks about the cable for
>ST Xformer.

Read and write to an 8 bit Atari drive, from your ST printer port.

The following shows how to build the cable:

Atari DB25
8 bit Drive plug
13 pin ST printer
plug port

2------------------------------3
3------------------------------11
4------------------------------18
5------------------------------5
7------------------------------7
10-----------------------------1

That cable and either the STxformer Pgm,(v2.3 or later) or the QTU
Pgm. is all you need.

Talking about C-lab, I thought you might like to read an email I just
got from them, it's in 2 to a question about budget priced
Falcons.............

From: Digital Awareness <digit_aware@cix.compulink.co.uk>
Subject: Re: Are plans to produce cheap Falcons?
To: ma2ljg@bath.ac.uk
Reply-To: digit_aware@cix.compulink.co.uk
X-Mailer: Cixread v3.5

C-Lab's license with Atari prevents them from selling direct competitors to
existing Atari models while they are still available. However, the Atari
machines are nearly exhausted now. I am going over to Germany on the 18/5
to spec out a cheaper machine which I hope we can show at the Spotlight
show in June. It will definately be under a grand. Watch this space (CIX)
for further details!

: >Remember, ST/STE is yesterday. TT too, even if a nice computer. Falcon
: >(don't say it's yesterday too - because almost every computer becomes
: >that very quickly ;-) is today, and even tomorrow for many ST/STE-owners.

: If the TT is yesterday, the Falcon is too... I thought of buying a Falcon
: but the 1040 style case, the 16 bit memory, the 16 MHz clock and the lack
: of a decent standard bus prevented me from buying it. I am very happy with
: my TT as it has fast memory, VME bus, seperate keyboard, built in
: troublefree SCSI, standard FPU.
: Since I have no need for 16 bit audio (the 8 bit in the TT is pretty good)
: but do like speed, I think the TT is not dead yet. The only thing I miss is
: the possibility to put in another processor like a 68040 or 68060.

I meant this: Falcon is still manufactured, and even developed (C-Lab
hopefully brings out a 040 model soon enough..), TT isn't. I think TT is
a great computer.

: Currently I'm running 800x600x256 @ 70 Hz on a home made VME-VGA adapter, in
: contrary to the Falcon this doesn't hog up the processor bus...
: Have you ever worked on a TT ?? With some fast-ram it just blows away the
: Falcon in terms of raw speed.

I've done professional publishing work with a TT w. 36 Mb of RAM, 21"
Nokia multisync, accelerated 24-bit Matrix graphics cars (2 Mb VRAM),
MatDigi 24-bit digitizer, Calamus SL, Shinko full-color SCSI printer, etc
etc. So I know what you mean ;-) ! A properly equipped TT is really a
great computer, I fully agree. Just wish I'd get a 040/060 board for it,
and a DSP...

: A Falcon is fine for doing audio stuff and TV video animation but for pure
: speed and expandability, I wouldn't swap my TT for a Falcon.
: Try running MultiTOS on a Falcon.... Or even Linux....

You can get 040 and lots of RAM for Falcon. And I guess, especially Linux
will look pretty nice on 68040-Falcon 8-) !

: Gert

Cheers,

Tommi

Maxtor drives are perfectly fine with Falcons. They just refuse to work in Mega STEs. Anywhere else, they work perfectly well - esp. on STs, where they are very effective and fast.

: O.K. folks I'm a bit stupid when it comes to anything other than eMail/news..
: HOW do I get these HTML files ????? I want to try it out !!!!!!

To get the files, you will normally have to use a web browser.
Lynx/MiNTnet will work fine for text browsing, and you can save an HTML
file by downloading a link. Unfortunately, getting the pictures that go
in web pages will be slightly more difficult, unless you find the exact
URL by looking through the HTML of the document the picture's in.

Alternatively, there's an email-WWW interface (at info.cern.ch IIRC) which
I think allows you to receive unprocessed HTML. If anyone's interested
I'll find and post some more info.

ATB,

Martin

Does anyone know what modification is needed to make a second floppy drive work on a Falcon? I have my Falcon in a DeskTopper case and believe that it's a case of soldering one of the wires in the floppy drive ribbon cable onto one of the legs on the multi-function peripheral chip, but which wire and which leg? I believe there has been an article on this in ST Computer. Any advice gratefully received.

Date sent: 8-MAY-1995 23:04:30

Hi,

This might be a question that has been posed earlier, and it might be
an extremely stupid one, but I ask it anyway.

Is there any way to connect my 1040STF to my VGA (PC) monitor? The
monitor is a primitive one (It can only go up to 640x480) (so no SVGA).
When I connect it, the even lines on the screen shifted approx. 1.5inch
with respect to the odd ones. So if there's any solution.... Don't hasitate!

Well, and if there is absolutely no solution, how can I get it hooked
up to my (PAL) TV-Set?

SO! If you know something, please E-mail me (adrian@morra.et.tudelft.nl)
I don't read NEWS too much, so if you only post something, I wouldn't be
able to see it.

Thanks, Adrian

Why would the best ST PD library want a second floppy drive on a Falcon? ;-)

You need a 74LS00 TTL-Chip and put it between the Shugart-Bus from the Falcon
and the Shugart-Bus to your two drives. DriveSelect0 can be put through to
both drives, DriveSelect1 is generated from DriveSelect0 and MotorOn.
Be sure to have jumpered your floppies right (0 for drive A and 1 for Drive
B).

Connect motor on (Shugart pin 16) to 74LS00 pin 1 & 2

Connect 74LS00 pin 3 to 74LS00 pin 4

Connect DrvSel0 (Shugart pin 10) to 74LS00 pin 5

Connect 74LS00 pin 6 to DrvSel1 (Shugart pin 12)

(I got this mod. from Thomas Ludewig)

Get an archive called ckbd_13.zip. It contains CKBD which is an excellent
keyboard driver with support for all ascii characters. It offers various
methods to type foreign characters, such as the 'composed characters'
method or deadkeys (type " and a and you get a-umlaut).

>would also be nice if I could print other things like the 'smiley face'
>and things that are part of the Speedo font set. Is there some trick I'm
>missing? This seems to be a very vital part of the program. How, for
>example, would a German user use Atari Works? Thanks for your help!

In general, Speedo text fonts contain about 560 characters. Programs can
support this number of characters but most don't since it is not that easy
to do. However, there's a way to configure SpeedoGDOS (and NVDI3 too) using
a table which tells SpeedoGDOS which character to display for certain ascii
values. This is being done by putting a spdchar.map file into your font
folder. This file contains the table mentioned above.

To create this file there's a program called Charmap5, but I believe there's
only a German version around (on ftp.cs.tu-berlin.de IIRC).

You may also look for an archive called setkey01.lzh. This is an editor for
.ckb-files used by CKBD. The documentation (ST-Guide hypertext, in English)
also contains a spdchar.map which enables you to type German and Polish
characters.

Finally, there should be an archive around called spdchars.lzh. It contains
large 300-dpi-images of the full Speedo character set. There are pictures
of standard text fonts and symbol fonts in there.

Anyway, the standard Atari character set already contains umlauts and other
special characters and usually SpeedoGDOS is configured to display them as
as well.

Hi Jared, that price I mentioned came out of a MAC Store catalog in Canada.
The ZIP drive will likely be cheaper in the US. I don't know what import
taxes are like for Australia but you can see the difference made in simply
crossing the Canada US border+retail markup.

Why not? Not everyone wants to run out and by a SCSI adapter plus the drive.

It just pushes the price up. If the parallel port is used you also have
a fairly common interface between many types of computers.

Later...

I'd like to thank everyone that helped me write my little review with SunDog. The more people talked about it, the more I realized just how &^$^%$ good that game was. In fact, one person dug out a copy to check some of the items in my article and ended up playing it for several hours, how's THAT for holding power?

Thanks again everyone.

Another option is one of the DOS mounters for the Mac. Apple's
PCExchange is one. You can just pop the Atari disk into the drive and
away it goes.

Out of the ether, the following was mentioned by Graham...:

GI> Of course you are an Atarian so you make the best desicion ..the
GI> Contemptible world in general does not know a good thing if it walked
GI> up to it and slapped it on the face and in %age terms the position of
GI> o/s2 is very very small.
But its on the increase in a large market (unlike our poor Atari's :-(

GI> Thats is the problem and my hunch on that is this the due to the flaw
GI> in the GDI.
Its not actually a flaw but rather a limitation (GDI for some reason is limited
to one 64k segment, so once thats used you cannot have any more!)

SD>> Was SMS2 the one on a cartridge you was thinking about?
GI> yes , I think you are the only user are you not :-)
Bitch! ;-)
Its full of good ideas and small and fast, but not very polished (a bit like
Unix, except for the small and fast bits ;->

GI> TOS/GEM (or perhaps MAgiC even)is the best stand alone system (IMHO!)
GI> by far , its clean, stable and does not impose unneccessarily
GI> overheads on the hardware.
Agreed. I get to use so many different OS's that I tend to think "oh this is a
good idea" or "this is well implemented" and I would like to develop an OS that
gells all of the bits together into a usuable and enjoyable (pervert that I am
;-) OS. Alas my programming skills are not quite up to that level yet, but
maybe one day.....

GI> Add the requirement's of networks and multitasking and its open
GI> season on headache land , Atari users don't have a system and PC/Mac
Thing is, a well thought out and planned system should be able to negate these
problems (if approached from the right angle). But generally money is the
driving instinct and a need to rush a product out onto the market and then milk
it for all the profits possible (re: MicroSoft).

GI> :-) . Magic (when the Falcon version IS released) might be worth
GI> something but only if it supports device drivers and MinT. Otherwise
GI> I am looking to MinA to add to my increasing interest in MinT-OS as a
GI> possible future O/S config for my Falcon .
Magic and a Barracuda!!! ;->
Who knows I might get sufficiently proficient to be able to implement my
QuantumOS ;->>>

I don't know where you obtain the LZH files from. But if they are from a ftp
site, then did you remember to use 'binary' transfer mode instead of 'ascii'
transfer mode in your ftp porgram? This may be the problem you're facing.

I have heard, that Wizztronic is planning a Falcon-clone. Can someone tell us more details about that?

Bye the way, in the latest issue of ST-Computer there is an advert for the new Atari-clone Eagle. The price for the 33/66 MHz 68040-machine is around 2700 DM (without graphic-card and RAM). A PPC-603 (?) card for the Eagle is under development, and should come out later this year; price will be probably around 1000 DM.

Message-ID: <3onlm0$i5q@rzsun02.rrz.uni-hamburg.de>
Source record: 165939

Hello Steve,

| Does anyone know what modification is needed to make a second floppy drive work
| on a Falcon? I have my Falcon in a DeskTopper case and believe that it's a case
| of soldering one of the wires in the floppy drive ribbon cable onto one of the
| legs on the multi-function peripheral chip, but which wire and which leg? I
| believe there has been an article on this in ST Computer. Any advice gratefully
| received.

it's a little bit more complicated, you need a standard 74xx chip also, but you
don't have to solder on the main board. If you are interested, I can look it up.
BTW: I have a 2nd floppy drive running on my falcon, so the solution from
ST-Computer works.

Greetings,
Thomas

: MG> no documentation, so if there are any tricks to it, could someone
: MG> please let me know?

: of objects before you start, and too many will use up lots of ram. Also, it
: only really likes POV2.2. It was a bit of hassle getting it to talk to
: FTPOV2.1 (which I refuse to compromise on, due to it's much greater speed)
: as the parameters are a bit different.

I've used EDPOV quite a bit now and I have to agree its a tad 'strange'.
It is also very buggy, for example select the sphere option and watch it
crash out with TOS errors (Failed to allocate window memory). Defining
the basic objects is easy enough and moving them around is quite simple,
adding textures to them is a dream and can save a lot of time. But for
composing an entire image, forget it, its just too darned hard to master
and tricky in use. Best thing you can use it for is loading 3D2 images
and converting them to a POV include file, its a god-send in that
department. Now all we need is the ability to use Imagine objects....
dream on... dream on....

Rich

PS - Where can I FTP Faster Than POV from? I've not seen it anywhere yet.

To the person who wanted the English Docs for Crack-Art...

They should be available via FTP at tu-clausthal.de or any other major Atari FTP site under the name crack_eng.lzh or something similar.

However, don't delete the original German ones yet as the English ones aren't a complete translation! (At least the ones I uploaded weren't).

Frankly, I'm surprised you haven't seen the program before. Its been out for a while. Crack-Art is one of the BEST gfx programs I've EVER seen on both the Atari and PC platforms. Enjoy it.

Ari

Not really. The cheat helps to pass the harder levels. It's really useful as some levels are so hard that they're discouraging. But it's true that the cheat crashes often.

Hi Kids,

I would appreciate any information regarding an English
translation of the Junior Office Fax package.

The one on Hensa is still German, and my German is conversational
only :)

See .sig for reply address or post here.

Thanks in advance,
Dennis R

> a menu, realising you're in the wrong application, and switching back.

Without wishing to disparage your reading skills, it may be worth pointing out that the top right hand corner of the Calamus screen (at least in v1.09) contains a brief help text describing the icon currently under the pointer; all you then have to do is learn the functions, a necessary process no matter what interface.

There is however a more interesting underlying argument here regarding how a DTP package should work. Without wishing to pull (DTP-)rank on you, I have, over the past few (8-10) years used somewhere in the region of a dozen different DTP packages from AMX Publisher to Quark and Impression and from Framemaker to Ventura and TeX. DTP gurus will recognise the distinction I am making here - the first group are strongest at dealing with free layouts, utilising lots of irregular graphics and strange text styles and orientations and generally allowing the user to splash things onto the page.

The second group, however, are far better for more repetitive tasks - books, papers, theses and manuals are among the jobs that spring to mind. Only a masochist would try to put together a book in Quark; only a fool (or a god) would produce an advertisment using TeX. Horses for courses.

Calamus is (IMHO) in the first category, although its ability to handle bulk text is up there with Impression and well ahead of Quark. But, as an essentially frame-based program, it is only to be expected that most of the interfacing with the user will be mouse-mediated (rather than in the form of CLI command+switch(es)+argument(s) or the embedded commands used in TeX); a corollary of this is that specialist programs need to adopt a distortion of the GUI; otherwise we get the ridiculous situation in Mac Cubase where changing tools in a window involves clicking on the Tools menu item which, in turn, shows a toolbox which you then click on to select a tool. On a nice large screen (say 19"), this involves a not inconsiderable amount of mouse movement. By contrast the ST way of doing it (click the right button - toolbox pops up under the pointer - select tool or go with pointer (default) - carry on working where you were) doesn't comply with what was intended for the right button (AFAIK) but does make the user interface a lot easier to *use* (rather than appreciate as an example of "Programming-by-guidelines").

While I would agree that there is a common set of low-level interface rules which should have been, and still should be complied with by developers (start menus Desk File Edit, use control C,X and V for copy, cut and paste etc), there is no way that all applications can sensibly adhere to a CUI - I don't expect my paper address book to operate like my synths or my HPLC; why should my cardfile look like my sequencer or my datalogger. Sure - maintain similarities where justifiable (why won't Calamus use the file selector?) but the UI should make using the program as easy and as intuitive as possible for the user and in some cases the "sheet-of-blank-paper-plus-menu-bar" metaphor is just plain wrong.

> I remember in the last issue of the Atari developer's newsletter which I got,

> keyboard, dialogue boxes, colour, language, principles of interface design,
> design considerations ... you name it. And at each step, it explains WHY
> Apple recommends you do things the way it suggests. It's 386 pages long.

I have in front of me the RISC OS 3 Style Guide (130pp). I quote:

"One of the most important aspects of developing applications to run under RISC OS is to make sure that applications within the desktop world present a consistent and reliable interface to users. This applies both to how an
^^^^^^^^^^^^^^^^^^^^^^^^
application looks and how it behaves." My interpretation of this is that Acorn are saying: Make sure that your app. does what the user expects it to do - don't put in any hidden suprises. IMHO this is precisely what a style guide should do - don't proscribe change or innovation, only confusion.

Incidentally - IIRC, the button bar had no part in the original Mac GUI: is it de facto a bad thing? Ditto flying dialogue boxes?

Sorry if this came over a bit like a rant - it's just that I felt I had to get it off my chest.

2451. Trying for a MiNTy fresh feeling

Newsgroup: comp.sys.atari.st
Date: 1995-05-09 00:00:00 UTC
From: Auburn Placer County - Tahoe City <libaubt1@nic.cerf.net>
Message-ID: <Pine.SUN.3.91.950509095141.26801A-100000@nic.cerf.net>
Source record: 165957

Heh..pretty tacky subject line, eh? :)

Hi All!

I'm trying to install MiNT, MinixFS, KA9Q-NOS, X11R5, Mint-Net, and MiNTOS, but guess what? I'm having trouble (surprise, surpirse!).

So far, I've gotten the MinixFS, the KA9Q-NOS, and the X11R5. And MiNT. MiNT was EASY to install. No problems at all! I have completely read the MiNT documents, and am a MiNT expert now. I have completely read the MinixFS docs, and feel that I'm a MinixFS expert now, too, but:

...I can't get MinixFS to work. I downloaded the source code too. I have a Falcon030 4/84, with a 10-meg partition that I'm trying to format for MinixFS. This partition is drive D:, NOT C:, so I know I'm not wrong there. I run MINIT.TTP: minit -V -n 2 -P D:, which should allow for a 10 meg, 30-char file name partition, which is protected. It _says_ it did it. Then, I run: minit -t D:, and it _says_ everything is fine. Then, I run: mfsconf D:, and it says, "Path D: is not a minix partition." Crazy computers! Go figure! Any help?

I have the minix.xfs in my root directory on C: (my boot drive). I have the latest version of MiNTNP. My mint.cnf file reads:

```
INIT=C:\multitos\gem.sys
NOS_ROOT=C:\nos
```

That's it! What am I doing wrong? (screaming) Why won't it work?? :)

I wanted to stick with MiNT so I could easily transform my system back into a real Atari. For all the grief I'm getting though, I might as well switch to Linux :(

Thanks for any help :)

It's not true "to a point," it's true period. The fact that some programs that are written badly might cause the system to slow down does not change the fact that it is still multitasking.

>If the software hasn:t been written to run cooperativly then it will slow
>the system down. In the program:s main loop, you have to add a call
>which will give the OS a chance to allow another peice of software to run
>for a while. This is not the case with pre-emptive.

On the Atari, any AES call could possibly cause a context switch, but usually evnt_mesag() or evnt_multi() is the call the programmer uses to pass control to other programs while waiting for a GEM event. The Mac uses WaitNextEvent().

Mag!X is from the same people who wrote KAOS ;-) MagXDesk is the
same Desktop as KAOSDesk - just the version von Mag!X.

EASE is a totally different product - it is just sold together with
Mag!X by ASH - but it's not from Andreas Kromke!

>switch to Linux :(

Might as well go with Linux. I found very little crossover from my MiNT
setup and my GEM setup...that is, I never ran the same programs under MiNT and
"single-TOS".

You do not need to transform your system to Linux, just have the
partitions on your HD for it. Apparently there are ways to keep your system
from booting normal TOS, but I didn't go that route. I still have a C:
partition with all my Atari Software. My D: partition is the Linux partition
and E: is a linux swap parttion, neither is visible to TOS. I have Partiition
F: as a minix partition, which appears as drive D to TOS. This is where my
MiNT setup is, which still gives me MultiTOS when I want it.

So every time my system boots up to the Atari Desktop. I then run the
bootstrap program with my kernel and root device. Not much to convert back
if I decided to stop doing Linux (and go to something else like FreeBSD).

Nothing new there.

> - LAN port (AppleTalk-compatible), 115 bps serial port, 2-direction

On the issue of the LAN port - did it come with a Chooser and such to actually put you on the Mac LAN? I mean, a port is useless without the software, what software did it use?

And was the port also a serial port like on the Mac?

I still say the best port in history was the one on the 8-bit Atari's, you could daisy chain it.

> A socket for 68882 math co-processor 16..50 MHz

Did the OS invisibly support it? Or did you have to code for it?

Yeah, but every car that comes out has its brake and gas pedals in the same
place, the steering wheel in the same place, the windows and doors all in the
same place... It's the same way with a standardise interface. When everything
behaves the same way, and objects all look similar to each other, there's no
confusion.

How many DOS floppies are there that are 1.8Mb?

Hutch (hutch@ilmen.lanl.gov) wrote:
: In a previous message, gs01tph@panther.Gsu.EDU (Tommi Pekka Hietavuo) wrote:

: > It must have some great logic behind it - but unfortunately we Atari-users
: > (spoiled with NeoDesk) are too dumb to see the light =-) !

: Gee, Tommi... I really wish you would STOP speaking for ALL Atari-users. If
: YOU find something YOU think is dumb, then state it that way, OK? But kindly
: do NOT include all of the rest of us just because YOU feel a certain way.

: Believe it or not, your experiences are not necessarily global in nature.

Sorry, Hutch - but nobody's perfect... I may express my opinions too strongly, but the idea between by lines should be readable.

And, believe it or not, practically all the Atari-owners I know in Finland, think more or less the same way. So you wouldn't like their lines much more than mine, I'm afraid.

I've noticed that many American Atari-users seem to be more critical toward Atari, and more favorable toward Macintosh, than people I know from Europe. There is some kind of a "cultural collision", though it's hard to understand, why...

It's different for you, because using Mac seems to be about as enjoyable as using e.g. Falcon to you - am I completely wrong? But if you want to understand my comments, try to imagine people who use Mac (often with great expectations) - only to find out that they really don't like the way it works. Some people try to convince you: "...hey, but surely you MUST understand that this car is really good - or what's wrong with you?..." - but hearing that most people find Mercedes Benz an excellent car doesn't mean that you -personally- enjoy driving one? Perhaps you just prefer your Mazda =-) ! I know enough people who'd think I'm crazy, if I seriously said like that. They don't understand me. I don't understand them. Neither is right or wrong.

I really believe that there are lots of us, to whom Mac isn't an alternative to ST or Falcon. In Europe, at least.

: How many DOS floppies are there that are 1.8Mb?

One would be enough - when you need one... I try to avoid floppies
bigger than 82 tracks and 20 sectors (about 1.6 Mb), because their
reliability decreases dramatically beyond that size. But temporarily, a
good floppy can hold as much as 84 tracks and 22 sectors, if your disk
drive can handle that much. Sometimes you only have one floppy with you
somewhere - and need to copy something bigger than 1.44 Mb... That's when
special formats are handy. For TOS they cause no trouble; the OS handles
about everything your disk drive is physically capable of handling. For
DOS non-standard disks cause problems, unless you use utilities like
"FDread". For Mac... Well, if there is a solution existing to read
oversized floppies, I don't know it. I recently read that MagiCMac has
trouble handling these disks, too - because of Mac's design. Maybe
someone knows this better ?

Anyway, 1.62 Mb floppies work perfectly, offer more free space, and even
work a bit faster than 1.44 floppies.

2467. 040 accelerators

Newsgroup: comp.sys.atari.st
Date: 1995-05-09 00:00:00 UTC
From: gs01tph@panther.Gsu.EDU
Message-ID: <3oms50$ja3@sphinx.Gsu.EDU>
Source record: 165973

I just browsed a Mac World magazine (they really fear Windows 95, it seems - so maybe 95 isn't crap, after all..), and saw something pretty disturbing.

It seems like you can have 68040 accelerators to Mac for as low as $300 (LC-version) ! Even full-sized 25..33 MHz 040 cards for Mac cost only $400..$600.

Which raises one question:

WHY does Barracuda-040 cost twice as much ..?
and WHY does German Afterburner-040 cost 1500 DM (about as much)..???

If this pricing strategy goes on, I may finally decide to agree with Mac-folks, and change the wagon. Owning an Atari should *not* mean paying twice too much for everything, IMHO >=-(!!!

I also read that the accelerator market for Mac (68000-series) is declining fast, as people move to PPC. So, if they can sell 040s for $400, for example, I'd think a Falcon-accelerator might cost $600 at most! Something is wrong here... And it hurts us all.

GZIP is not a patch on STZIP or PKZIP, try and ZIP a disk drive with folders
and files with GZIP, it can't it only will ZIP a single file...

P.S.. don't use the German version of ZOO as it can't do what the USA version
can, the German one is a Unix port were the USA one has Atari features added...

Where did you see the word 'patch'? I didn't say it's a patch, I said GZIP
claim to be better than ZIP. It uses a different compression algorithm, which
is suppose to give a better compression rate.

: Cooperative multitasking *IS* true multitasking -- the scheduling is simply
: different than in preemptive multitasking.

To a point this is true, but while any program, however written, will
multitask well on a preemptive OS this is not the case with cooperative.
If the software hasn:t been written to run cooperativly then it will slow
the system down. In the program:s main loop, you have to add a call
which will give the OS a chance to allow another peice of software to run
for a while. This is not the case with pre-emptive.

Yup, and a shareware version too.

> computer to use. But then again, not many Macs can do 16 bit hard disk
> recording and DSP sound processing "out-of-the-box", can they? Falcon can.

They all include 16 bit direct-to-drive recording and sound processing out of the box, yes. Some also include a DSP, but they found on the PMacs that a DSP was actually slower than letting the CPU do it.

All Macs since 1992 (?, 1 perhaps) ship with stereo out, microphone in (and the microphone), CGA, SVGA etc. video out and such. Some Macs also include complete video in, and on the PMac's it's simply a card you plug in. Some Macs also include a IR remote control and a TV tuner in them too.

>interface.

There are always going to be complex functions in some programs which are not
going to be immediately obvious. Sometimes this simply can't be avoided,
due to the nature of the program. The point is that having twenty or thirty
often-cryptic icons on the screen is no easier to understand than twenty
or thirty CLI commands typed at a UNIX prompt. Having to look at description
slows you down, and, just as with a CLI, you end up memorizing what all the
icons do. What would have been better would be to use the icons where it's
appropriate -- for placing frames, drawing objects, and so on, and use more
traditional stuff like menus and dialogue boxes for the other stuff.
Having a bewildering array of icons, and icons that bring up icon submenus,
is confusing and runs contrary to what an Atari user expects from his
interface.

[extensive talk of different DTP programs deleted]

I'm not a DTP guru, so I'm not really prepared to discuss all the different
DTP programs out there.

> otherwise we get the ridiculous situation in Mac Cubase where
>changing tools in a window involves clicking on the Tools menu item which,
>in turn, shows a toolbox which you then click on to select a tool.

I haven't seen CuBase, but I assume that the menu item you're referring to in
the Tools menu has a submenu attached to it with icons of tools. That's, in
fact, a violation of the HI Guidelines on the Mac. Submenus are to be
avoided unless *absolutely* necessary. A more appropriate way would have
been to have a floating toolbox window that the user can move wherever he
wants.

>While I would agree that there is a common set of low-level interface rules
>etc), there is no way that all applications can sensibly adhere to a CUI -
>I don't expect my paper address book to operate like my synths or my HPLC;
>why should my cardfile look like my sequencer or my datalogger.
...
> in some cases the "sheet-of-blank-paper-plus-
>menu-bar" metaphor is just plain wrong.

Maybe I'm not making myself clear and that's why everyone is misinterpreting me.

I'm not saying that every application must operate in exactly the same way. Of course it makes no sense for your card filer to look like your sequencer. Part of the design process is to choose an appropriate metaphor. A card filer program might work best if it acts like a Rolodex. The Finder uses a desktop metaphor.

What I mean by "common user interface" is that

* Items such as windows, buttons, icons dialogue boxes all work in the same way.
* All programs adhere to the principles of direct manipulation, see-and-point, consistency, feedback, forgiveness, user control, and stability.
* Items that look different act differently.
* Items that look similar act similarly. Interface elements should not look different just because the programmer thought it looked "cooler" that way.

These are some of the basic principles outlined in the Macintosh Human Interface Guidelines. They are general and should apply to every platform, not just Macintosh.

>I have in front of me the RISC OS 3 Style Guide (130pp). I quote:
>"One of the most important aspects of developing applications to run under
>RISC OS is to make sure that applications within the desktop world present a
>consistent and reliable interface to users. This applies both to how an

>are saying: Make sure that your app does what the user expects it to do - don't
>put in any hidden suprises. IMHO this is precisely what a style guide should
>do - don't proscribe change or innovation, only confusion.

That's what I've been saying all along, and that's what the Macintosh Human Interface Guidelines say.

>Incidentally - IIRC, the button bar had no part in the original Mac GUI: is
>it de facto a bad thing? Ditto flying dialogue boxes?

No. The Macintosh Human Interface Guidelines talk extensively about extending the Macintosh Interface:

Let me quote from the Macintosh Human Interface Guidelines. (Snippets taken from pages 38-40)

"When a need arises that can't be met by the standard elements, you can extend the user interface by creating combinations of standard elements or new elements."
"When you do use existing interface building blocks, use them in the the standard way. Make sure you do not change the behavior for standard elements. When you need a new behavior, design a new element for it. If elements behave differently in different situations, the interface becomes unpredictable and harder to figure out."
"As a general rule, be cautious about creating a new interface element because you may end up introducing unnecessary complexity to your product.

Before you create a new interface element, make sure that you can't use
existing elements to achieve the desired result."

If you have TOS 1.4 or greater then the standard 720k format is
readble by a PC. If it is earlier then there are somme progs that do
it but I found that the formatter in Freeze Dried Terminal did it
fine.

You can read and copy to PC formatted disks as long as they are single
density and 720k.

Hope this is what you meant?

Look for a programme called TTerm214.zip. This is Teddy Term and it
definitely has a VT100 emulation mode. If you get stuck I could send
it to you through email or through Fidonet.

As of TOS 2.06 the disk format is IBM so there is no problem. The main
difference between the old ST format and IBM was that the ST version didn't
write the media descriptor byte (only 1 format so it wasn't needed) which
made the PC throw up its hands in horror

> that is. It's hard to defend your choice every **** time you meet
> someone. I guess, this creates a "ready to defend" -attitude. You
> expect trouble - and behave therefore aggressively yourself.

Back in 1990 when I had just joined the Britsh Civil service as a computer specialist I was asked by my boss, as part of my skills building, to give talk on "why Ataris are crap". This really pissed me off so I spent a few days builiding up an application shell in GFA basic so that I could show my boss, who claimed that event driven programming was almost impossible, that somebody on 50% less pay could construct one on the "crap" Atari when he couldn't even start to build one on a PC

Ah, such is life

Steve

Tommi:

I agree with you that its good to have the capability to format a 1.8meg floppy - if you're backing up your HD and and don't plan to use such disks often, then its not a bad idea as long as you understand the limitations (and I think you do).

As for the Falcon...

I now have a 486 PC (no flames, please!). I'm pretty happy with it. I wouldn'tsay its better than any ST just different and more suitable for my particular needs, etc. I miss my STe and Falcon - both were fun and exciting machines to work on...but when you're trying to use your computer to help earn a second income (like I've been trying to do) or need it to run a certain program for a certain class, etc the Falcon just doesn't cut it for me.

Regards,

Ari

2486. XTRA RAM board for 520ST

Newsgroup: comp.sys.atari.st
Date: 1995-05-09 00:00:00 UTC
From: epp@world.std.com
Message-ID: <D8BpFz.9pA@world.std.com>
Source record: 165992

Toad Computers here in the U.S. sells a product called the XTRA RAM board, which will allow the RAM inside a 520ST to be upgraded to 4 Mb of RAM. The description states that this board is "solderless", which is good for people who do not know how to utilize a soldering iron. From what I can recall when I last looked at the motherboard, I don't remember seeing anything on the 520ST motherboard as to where this XTRA RAM board could be plugged into.

Does anyone have this board, and could they explain how it is installed?

Thanks!

2487. Original ST release date?

Newsgroup: comp.sys.atari.st
Date: 1995-05-09 00:00:00 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950509182246.5983C-100000@PEAK.ORG>
Source record: 165993
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

Hello all! Bob Retelle is being a dork again, and as usual, he's wrong about the Atari - as he is about most everything he posts about.
We were talking about the original release date of the Atari ST - which was in 1985. I'd been waiting for an ST and called the local Atari dealer on a daily basis as the time drew near, so I remember the date well. Perhaps someone intelligent can enlighten bobbie. Here's what he said:

On May 8, 1995, BobR wrote: (in the "C-lab Falcon" thread)

BR>Back when the IBM PC, the Amiga 500 and the Atari 520ST were brand
BR>new, the playing field was a lot more level (of course, the PC had the
BR>IBM name behind it, which was probably an insurmountable advantage
BR>over the other two).

I tried to correct him about this - explaining that NONE of the three were "brand new" at the same time, and can you believe he argued with me??? (1) IBM PC was new in 1981, (2) Atari ST was new in 1985, (3) Amiga 500 was new in 1986, possibly later - I'm not sure since the AMIGA 1000(!!!) was the original competition for the Atari ST and *IT* was before the 500.

!!!get a load of his smart(dumb)-ass response!!!
|
|
\|/

On May 9, 1995 in Email to me, BobR wrote:

BR>Unfortunately you don't seem to even have that much knowledge.

BR>If you knew ANY Atari history, you'd know the Atari ST and the Amiga 500
BR>were released within weeks of each other in 1986.

BR>Thus you got both dates wrong.

BR>Find one of the books on why Atari failed bigtime, and have someone
BR>who can read, read it out loud to you... it should cover that time
BR>period.

I can't believe someone can be so much in ERROR and such a smart-ass about it. Can someone please enlighten us in regards to the proper release dates to the IBM PC, Atari ST, Amiga 500, and since it's relevant to the discussion, the Amiga 1000?

I still have the January 1986 BYTE magazine with the Atari 1040ST on the front cover - and we all know that the 520ST came before....so it looks

like BobR is wrong for sure.... He'll never admit it, but give it to him anyway....

James

From: Auburn Placer County - Tahoe City <libaubt1@nic.cerf.net>
Subject: Networking, MiNT, and what!
Date: Thu, 4 May 1995 22:09:05 -0700

I had a question. I know I can transform my wonderful Falcon into a
pseudo-Unix system, but what good will it do me? All I'm really
interested in is a kick-butt multitasker, and some Internet www browser
(which, I bet, there is none). By looking at MiNT, Minix, Linux,
MultiTOS, and whatever else, am I going in the wrong direction? What is
Minix? Heck, what is Linux?? For that matter, what the heck _exactly_
is MiNT??? And does any of it have to do with telecommunications?
-=-=-=-=-=-=-

Well, it's more than one question at once:

MiNT

MiNT is a Unix-like kernel compatible with TOS (in fact a TOS extension).
You can turn your Falcon into something, which normal user won't recognize
from Unix. With MiNTnet (a XDD device driver) you will also have complete
networking environment with ftp, telnet, finger, nfs, talk and this stuff.
With MinixFS (==> Minix File System), you can have Unix filesystem with long
case sensitive names, links, symbolic links, i-nodes etc. I run this setup
and I'm quite satisfied. MiNT is also supplied with Atari's MultiTOS.

Linux

Linux is a free Unix clone. If you know Linux on PC, then Linux for 680x0
processors is the same.

Bye Borek

Thanks - I went for an ext2 fs in the end.

> > Now the problem *I'm* having is that many commands give me:
> > Unknown error -2
>
> Your tools might be out of sync with your shared libraries. You're

This was it.

I was using the libraries that came with the tools - and the kernel wasn't very happy. In the end I used the libraries which came with the RAMDISK, and put in soft links to the library names that the tools expected. I don't know how 'dangerous' this is - but it seemed to work.

The usr.tar.gz came from TSX-11 via the InfoMagic Linux CD (March) set. All the files on the disk have a March date - but I don't really know how old they are.

Anyway - system seems *very* stable at the moment.

:-)

Hi Peter,

It's shareware, cost 10 ukp (or equivalent in local money plus 25%), you
should be able to get it from HENSA and possibly other main Atari sites.

The files you'll want are STOP104A.ZIP (full package, v1.04a) and
STP4BPTC.ZIP (a patch to convert 1.04a to b).

I wrote it, so if you want more info let me know or I can send you a
UUEncoded copy.

From: ai066@FreeNet.Carleton.CA
Message-ID: <D8DII6.K50@freenet.carleton.ca>
Source record: 165803

Firstly, I would like to thank Dave Small for posting his thoughtful replies to a few Spectre/SST questions. What I am curious about is how close the proposed 3.1 version of the Spectre software ever got to final release? HD disk support, as well as support for Atari's extended partition scheme would be very useful to me, being the owner of a mega ste, and I was really looking forward to upgrading to the new software after I read Dave's online announcements.

System 7 would have been nice, but it would probably have been so slow as to be unusable, from what I've read from regular Mac Plus users.

Thanks!

Those are totally separate issues. We were not talking about feature lists,
we were talking about ease of use -- given two interfaces which allow the
user to perform the same task, then the one that lets more peole do it quicker
with more accuracy is the better interface. Issues of speed, size, are
separate.

The last time I had a lot of fun not playing a game was poking about in HyperCard. I was trying to figure out something, I forget exactly what, but it had something to do with the date. I don't have a book or anything, so I think "hmmm, well I think it should be something like..." and it worked. I was so happy.

2504. XTRA RAM board installation for 520ST

Newsgroup: comp.sys.atari.st
Date: 1995-05-10 00:00:00 UTC
From: Edward Piecewicz <edward1@delphi.com>
Message-ID: <Re9+ToA.edward1@delphi.com>
Source record: 165810

Does anyone have the XTRA RAM board installed in a 520ST? This board is currently being sold by Toad Computers in the U.S.

The description states that the board is solderless, but I do not recall seeing anything on the motherboard as to where this would connect to.

I'm curious to know how easy this is to install, as I am considering purchasing one.

Thank you.

2505. WWW by e-mail

Newsgroup: comp.sys.atari.st

I know how to get web pages by e-mail but these only arrive as plain text files.
Is there a way to get HTML files along with any associated graphics so I can
make use of that new HTML browser ?

Cheers.

Please, please....
Does anyone know of an ATARI EMULATOR for the Macintosh.
If such a thing exists Iwould like to know more details.
I think I've seen something out there but (how stupid!) I can remember
where...
Please help if you can.

Thanks in advance

Hi Barry,
Thanks for the info on connecting a second drive. It will make life a
lot easier when making up disks for the catalogue. It's hopeless having to copy
everything to the hard drive and then back to floppy.

Regards
Steve

Anyone know if you need to have any special software to run a Zip Drive?

Also, has anyone used a Zip Drive on their STe? If so, how do you rate it?

Any info will be helpfull, thanks,

Martin C

TOWERS II is a tryware game, which means that you can get the full version anywhere, but you have to buy the manual if you wan't to go further then the 3rd level. If you don't like the game, then you haven't wasted any money. That's tryware.

TOWERS II is avaible on ftp.cnam.fr.

Source record: 165819

Greetings from sunny Corbarieu, Rich,
I'm using an Alto V34 with a standard Falcon TOs 4.02, and a
Semper/jetmail/LED package without any problems. (HSMODEM 6 as well)
I average about 2500 cps and 24000 baud rates with 115800 DTE rates. No
problems encountered. Of course, I have to keep the modem's auto-answer mode on
all the time, as the Falcon's serial port "incoming call" wire is inactive.

He is, I bought my Atari 520ST (on-disk OS) in Sept 1985. The Amiga 1000 was JUST coming out, and the 500 came out about 2 years later.

He's just plain wrong.

The NEW Performa/LC 475 and 630 series Macs don`t have 16-bit sound.
They only have 8-bit sound. So not all post 1992 Macs have 16-bit
sound out-of-the-box.

The Macs with DSP-processors were the AV-series. No wonder their DSP-
chip was slow it wasn`t a Motorola DSP56001. :-)

By the way, it's only the PowerMacs that actually are fast enough
to do some realtime signal processing.
040 Macs aren't.

R> include file, its a god-send in that department. Now all we need is
R> the ability to use Imagine objects.... dream on... dream on....

I tried to do some work with it, but gave up due to the number of bugs and annoying 'traits' it seems to have - like selecting a popup menu and not being able to cancel without selecting one of the options - all of which have damaging consequences. That really is incredibly bad design!

Why is the configuration so bizarre? Why does it crash whenever it feels fit to do so? Why does the 'active object' rectangle jump up & left when you click on it with the mouse to drag it to a new location? That's a really crap bug which only the GEM Desktop can match (resizing windows, where the window size bears no relation to the the rubber-box you just defined with the mouse).

If I didn't have so much to do, I would be tempted to write my own shell, and that's pretty sad when there is one already available! Maybe when things cool down a bit...

R> PS - Where can I FTP Faster Than POV from? I've not seen it anywhere
R> yet.

Everybody asks me this, so I can only offer the same reply!

I don't have full Internet access and cannot yet place files on FTP sites, so I uploaded it onto a number of BBS boards instead, hoping it would spread this way. It seems I was wrong! :(

If you want to look for it, try the following...

RayTech BBS (Raytracing support for PC/Mac/ST/Amiga/Arc)
Falcon's Realm BBS (Falcon030 BBS, with TT & ST support)

There are a number of others, but you will just have to try your luck. If you DO find it, can you place it on an internet site for everybody else, as it seems to be in demand!

:)

Cheers,

Doug.

We'll have to gather there some Silicon Graphics or Cray users! :-)
Seriously, I truly wonder why these Mac-lovers subscribe this
newsgroup at all? Are they paid by some multinational companies
to confuse Atari users? Is this conspiracy against freedom of
choice?

>: They all include 16 bit direct-to-drive recording and sound processing
>: out of the box, yes. Some also include a DSP, but they found on the PMacs
>: that a DSP was actually slower than letting the CPU do it.

No a single one machine in the Macintosh family has a DSP-port. So, you're
not able to make DAT backups, digital DAT masters, record with DAT's
converters (or Apogee's!), add cheap analog audio expanders...
Reason? Digidesign rules, and that's not the kindom I wanna be in.

>Sometimes I wonder, where the FUN has disappeared from computing... I
>have fun with my Falcon, but definitely not with PCs. Let's hope things
>will get a bit less serious again, some day..

Falcon and SGI are the only machines that have given me those "ooh" and
"aah" experiences. PC and Mac are good tools, but if you stay with
your computer 8 hours a day for 30 yers, you begin to look like it.
There has to be something else in computing/computer than just plain
effectiviness, call it "a feeling" if you like. Computers *do* have an
aura!

RM> release.

Whether it is the same software that was talked about all those moons past or not there is indeed software that exists to allow TOS computers to use "PC based" CD rom titles like Groilliers Encyclopedia and quite a few others.

Available from "Its all relative" in the US (or is that Canada?) I forget.
The software in question is called SARA
I am waiting patiently for Systems Solutions to import it into the UK. I am told they even work with Standard ST's but I would think that a Falcon or similar is going to be the minimum to really get the most of of this.

I have the same problem. I even got a supposedly fixed version from
Micrprose UK. It seems they fixed some bugs but added others. Also, when
playing from a hard disk, if you start a revolution the playing screen
doesn't black out as it does when playing from a floppy. It's still a great
game though. I still spend to many hours playing.

2541. User Group Meeting Notice

Newsgroup: comp.sys.atari.st
Date: 1995-05-10 00:00:00 UTC
From: nickd@vpnet.chi.il.us
Message-ID: <1995May10.040717.6716@vpnet.chi.il.us>
Source record: 165878
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

The Suburban Chicago ATarians (SCAT) user group will hold its May meeting on Tues. May 16 at 7:30 PM at the College of DuPage, Room K 157 (the K building is on the south side of 22nd St. just west of Lambert Rd., in Glen Ellyn [IL]). The scheduled demo is: Various demo (and ?) programs on SCAT's 'new' demo machine, a 1040 STe, courtesy of our Vice President, Mark Biallas.

Also, I have something I videotaped off of the Discovery Channel that I'm sure will interest Atari/videogame fans (it's only 5 or 10 minutes long). I believe that our intrepid 8-bit Librarian, Joe Chiko, has an 8-bit demo too, with the help of (some of) his children (as I recall). "Surprise" demos are always welcome, too, especially now that we have the STe.

Everyone is welcome to attend. (Especially anyone who is thinking of joining SCAT :-) Feel free to bring your family.

For more information, send me E-Mail at one of the addresses below. [If this article shows up outside the greater Chicago area, I apologize - the "chi" distribution may not work (at all sites) now. Say, if you're travelling to the Chicago area and will be free that evening, feel free to stop by!]

Nick DiMasi, SCAT President

Don't know about the .dwg extension, but GFA DRAFT has a utility program
to convert .DXF files (some sort of cad file which AUTOCAD can produce)
to GFA format.

There is some limit to the size of files that can be converted though.

Maybe you could output the files from AUTOCAD in somw other format.

: Pekka Hietavuo) wrote:

: > The simple answer is: yes it does. MultiTOS comes with every Falcon.
: > And since ST is yesterday, the Falcon is everything we should think
: > about, now. Why speak of a computer of 1985..1990, that nobody
: > manufactures any longer?

: Which includes the Falcon!

Not.

Falcon's production continues under C-Lab name. Even the manufacturing plant is the same. Only the computer is better - and more powerful models are on their way... And if C-Lab doesn't say much to you, it's the firm behind e.g. the famous NOTATOR sequencing software (which today belongs to Emagic..).

How come this subject creates so many sour opinions on Falcon? It hardly seems we're in an _Atari support_ area - or are we..? Just like Jaguar area, this is changing into a battlefield of nonsense. Maybe I should really stop these answers, if people really want to see more "10 more reasons why Mac outperforms your ST..." -messages. It's pretty frustrating to be seemingly alone with these opinions. Maybe you Mac -people really have made a better choice. At least, you don't have to defend your choices in your own message areas every day!

: > : And if you want add ons, you can get boomerang for the Mac.
: >
: > I'd like to see that. Is it a commercial program?

: Yup, and a shareware version too.

: > computer to use. But then again, not many Macs can do 16 bit hard disk
: > recording and DSP sound processing "out-of-the-box", can they? Falcon can.

: They all include 16 bit direct-to-drive recording and sound processing
: out of the box, yes. Some also include a DSP, but they found on the PMacs
: that a DSP was actually slower than letting the CPU do it.

No surprise.

: All Macs since 1992 (?, 1 perhaps) ship with stereo out, microphone in
: (and the microphone), CGA, SVGA etc. video out and such. Some Macs also
: include complete video in, and on the PMac's it's simply a card you plug
: in. Some Macs also include a IR remote control and a TV tuner in them
: too.

TV tuner is handy, but that isn't very common in Macs or PCs yet, I think.. Atari and Apple have both made mistakes in their audio designs. Falcon's audio inputs needed re-design (done by C-Lab) because of bad frequency response, and too high sensitivity. The A/D converters Apple uses, are considered to be of bad quality (bad signal-to-noise ratio), too. So, both computers need some tuning for professional use.

And, please - no comments like: "there's nothing wrong with Macs audio...". If someone doubts, I guess there are professional musicians out there who can tell us more about both systems' audio problems. Atari isn't the only manufacturer in the world that can make design mistakes, after all...

C-Lab Falcon's audio seems to be o.k. At least, I haven't heard any criticism yet... Experiences?

Older Falcons can be fixed too with good results. It requires some soldering, a couple of capasitors, and a few resistors. But it's really worth the effort =-) ... The resulting frq response is linear between 30 and 19.000 hz (+/- 0.5 db).

: > : As far as I'm conserned, the most fun I've ever had with a computer was
: > : with my old Atari 400! Now THAT was a hackers machine!
: >
: > It's a pity I never owned one ;-) ...

: You would have most likely loved it. That box and a copy of Mapping the
: Atari and you had more fun than I ever had since.

Sometimes I wonder, where the FUN has disappeared from computing... I have fun with my Falcon, but definitely not with PCs. Let's hope things will get a bit less serious again, some day..

: >resources. At least we have choices according to our needs.

: Why not have a look at Papyrus, it puts MS WinWord, etc., to shame in the use
: of a GUI and in other areas.

You're absolutely right. But I'm afraid it's no use saying it here -
because some people would never believe us. You see - Microsoft is a
holy word for many people: how could possibly some Papyrus match software
like Word ? Some people would get a good laugh from the mere idea! And
they'd hardly bother to actually try the software, and see for
themselves.. They're not that interested in us, and our software.
But it's good to know that we *do* have many great programs =-) !

Prejudices are, unfortunately, sometimes impossible to change...

It's available for Windows NT. The version (SL) is similar to Atari
Calamus SL. The company is very much in business (DMC, Germany) - and
they're supposed to have a subsidiary in Canada. The firm I worked in
last year, ordered their SL from Canada.

They also sell lots of excellent (if expensive..) add-on modules to Calamus.

Greetings,

Tommi

Well, errrr, I tried to use the Maxtor 340 on my ST with two
other devices and never had any luck getting the ST with a Link to
"see" all the drives, however, by it self it is a good drive for
the ST but found a better home for it in my PC (yuck!). The Quantum is
still a very good power/price ratio for all the Ataris. Just
my experience. :)

bye, Mike.

Hi,

I have installed MiNT and MinixFS. It all seems to work fine.
BUT, when I put an executable on a minix partition it executes
even when the attributes are : -rw-rw-rw- (so no executable flag)!!

Anybody know of this problem?

> probably around 1000 DM.

I talked to Steve Cohen at Wizztronics a few weeks ago and he said
that they are currently looking at developing a clone that uses
the Power PC chip, now that Apple has opened up the market for its
O/S. He quoted some impressive specs, including TOS compatibility.
Their number in the U.S. is (516) 473-2507.

Call Wizztronics. I think their ram upgrade uses a 72 pin simm.
If it works like the other ram upgrades, that won't matter, I
don't think. Wizztronics (516) 473-2507.

|> : are completely unrelated.

Rubbish. Local bus means that the CPU can use it's own bus to directly access
the Video/drive/etc, unlike the AT bus, where a seperate 8Mhz bus (most
PC peripherals that don't use local bus are only on an 8Mhz 16 bit bus) is
accessed via a couple of registers in the CPU's memory map.

Source record: 165899

Hi,

Firstly, .gz and .z files are GZIPped files for which you require GZIP.

tar are TARred files for which you require TAR.

One you haven't mentioned, but which appears from time to time is .tgz,
which is a GZIPped file which has been TARred - thus you need to unTAR
firstly and then unGZIP (surprise, surprise!).

You should find both the GZIP and TAR archivers at src.doc.ic.ac.uk.

Look under packages/atari/umich/Archivers.

Other possible sources:

atari.archive.umich.edu
micros.hensa.ac.uk

Atari MegaST System for sale

Atari Mega ST2 upgraded to 4 megs (soldered directly to the mother board, no flaky upgrade boards), with AdSpeed 16 MHz accellerator. TOS V1.04 ("Rainbow TOS"). Detachable keyboard. Atari mouse. Best (brand) power supply. Works great. Original box & manual.

Atari Megafile 30 meg hard drive.

Golden Image optical mouse with pad.

Atari SC1224 Color Monitor.

Atari SM124 Monochrome Monitor.

Monitor Master monitor switch.

Atari SF314 double sided double density external floppy disk drive.

Supra 2400 bps modem, and a modem A/B switch box.

ICD Link II SCSI adapter

Star NX-10 9-pin dot matrix printer with extra ribbons. Original box & manual.

2 Wyco 3-Way Joysticks. 1 Epyx Joystick.

1 Atari Trackball.

ATARI ST SOFTWARE:

Utilities:

CodeHead stuff: Maxifile V3.0, HotWire, MultiDesk, Warp 9, Lookit & Popit, Diamond Back 2, Diamond Edge

Applications:

TimeWorks ST Publisher (Desktop Publishing), STraight FAX V 2.0, Data Manager Professional (Database), Mark Williams C (with debugger), more.

Games:

Dungeon Master, Chaos Strikes Back, GODS, Speedball (1 & 2), Magic Pockets, Cadaver, Flying Fortress, Wayne Gretzky Hockey, Their Finest Hour, Battlehawks 1942, Ultima 2,3,4&5, Sim City/Populous, many, many more.

Atari ST MIDI Hardware and Software:

Dr.T's KCS Omega II. Full MIDI sequencing package, including manual.

Dr.T's Copyist DTP. Full music notation package includes manual.

MOTU X-oR V2.0 Patch Editor/Librarian. Supports over 200 devices.

Dr.T's Realtime sequencer.

Dr.T's M interactive composition software.

Dr.T's Phantom SMPTE interface, which also provides an additional 16 MIDI output channels.

Books:

Several Abacus books, GEM programming, 68000 programming, C-manship Complete, Compute's Atari Technical Reference guites Vol 1-3 (VDI, AES, TOS)

Extras:

I haven't listed everything I've got, but if you buy the system, you'll get it all.

SYSTEM PRICE: $750, or best offer. You pay shipping (I'm in Massachusetts)

Call me at 617-497-2268, or e-mail me at jwhitcomb3@aol.com

I, like you, have chosen to use Flash 1.6 as my primary telecomm program for several features. I've seen the same problem. The problem seems to be that Flash 1.6 has XON/XOFF flow control enabled permanently, so even when you lock RTS/CTS, you actually get both. What I do when I know I am going to get a large chunk of text, I use Ctrl-S and Ctrl-Q to pause and then unpause it frequently tos low down the flow. There is a program that claims to modify Flash 1.6 to change the XON/XOFF with CTS/RTS, but I've never been able to use it as my executable has been packed with some packer and I can't seem to unpack it. I have come across an executable for 1.5 and keep meaning to d/l the patches to upgrade it to 1.61 so that I can try the RTS/CTS patch.

You could try this patch. I think it's on atari.archive, although I'm not sure.

I never actually understood why everybody hates you (never read the endless Atari vs. brand X threads) but now I see why. Your comments simply don't make any sense. No arguments provided, only dumb babbling in space. If you read carefully you will see that they are not comparing 520STs to PowerMacs. By the way, can't you all move over to the advocacy newsgroup?

Tsssssh,

Ivo.

>now but eventually you will and when you least expect it.

Three things:

1- Microsoft themselves switched to an extended HD floppy format for
software distribution - they are at about 1.7 MB.
2- A 20 sector format gives you more capacity with no extra tracks. That's
perfectly safe to do.
3- Formatting to more than 80 tracks really is a bad idea. Why? First, disk
manufacturers don't test the extra tracks. Second, almost no modern drive
can access more than 80 or 81 tracks reliably.

bye, Peter

Just format the discs at 720Kb on the PC.

You can avoid disks altogether if you use Ghostlink (PD) with a null modem cable. This gives you access to your PC partitions as though they were additional ST partitions.

: >Pekka Saarinen <contacts@mits.mdata.fi> wrote:
: >
: >Here it begins. Anyone who doesn't think the Atari is the best machine on the
: >planet is part of some grand conspiracy.

What about this: the best machine on planet for *us*. It seems like some
people just don't respect that simple fact. We don't visit Mac-areas to
boast with "the magnificent things our computers can do", and make Mac
users angry, do we? What gives them the right to do that to us?

: Nope. I see it (computer debating) like this:

: Your neighbour gets a new telly. It's not the best
: there is, but your neighbour feels it's OK for him/her. Now, you ring the
: bell and tell he's made a wrong desicion. What makes you do that?

: a) you want to do your neighbour a favour
: (no, he IS satisfied, so don't create new needs for him)
: b) you want to put him down, so you'd feel stronger
: (I refuse to believe that!)
: c) You want to make him buy the thing you've got, because if more
: people own the same machine as you do, the more secure you feel
: about your desicion.
: (yep)

: I think most of us fall into category c...

You put it right, can't disagree!

I think, many Mac-users feel the "a)" -way. They think they do us a
favour, because they can't understand how anybody can be happy with
computers like Ataris.. They really don't understand ;-) ...

I'd like to believe I'm wrong with this - but the "b)" -type of people
exist. They're people who just enjoy hurting the others. They grin, when
they see that their messages have created anger. There's a word for
them: as*holes.

"c)" is often for PC-users, I think.. After buying something nobody
particularly likes, you have to give yourself some good reasons for your
desperate deed 8-). O.k. sorry, you out there who really needed a PC! I
don't mean you. I mean people who just buy what the others buy..

: ----Pekka Saarinen

'm the Editor of "Voci di Corridoio - Atari Magazine", the new (six months old)

and the only one italian magazine entirely committed to the Atari market.

We include coverage about the International Section, for which we're always

searching for information from international distributors & developers.

Our magazine we'll be pleased if You can stay in touch with us (best if via

e-mail at: marco.greppi@pmn.it

or by fax) to give to our readers news and articles about new announcements,

products & upgrades You'll develop.

Thank You in advance (and keep supporting the Atari market!!).

Best regards.

Marco Greppi - Editor

Rod,

We have been Falcon developers since 1992.

Our details on in the signature below.

You can read all about our product on our web site at:

www.tecnation.com/tecnation/

Click on PRODUCTS and then on SONOVISTA.

Best use Netscape.

We require Falcon 030 4/x. So if you can get them for us, I will be greatful.
(Ideally with internal hard drives.)

Regards and thanks,

Alex Blok

Yes Stardust has been released, ages ago. The distributors (bloodhouse) just aren't doing too great a job, Aggression (the programmers) have had it finished for ages, I've had mine for at least 4 months.

: Another option is one of the DOS mounters for the Mac. Apple's
: PCExchange is one. You can just pop the Atari disk into the drive and
: away it goes.

Hopefully...

...But don't forget to backup your floppy first! I've lost a couple of Atari-formatted disks, when Mac's DOS disk reader (can't remember what it was) didn't like the disks - and ruined the disk directories completely.. =-(Whatever people may claim, there are problems in using some DOS- and many (especially older) Atari TOS floppies with Mac. The only safe way to do file transfer may sometimes be this: format the floppy in _Mac_, to DOS-format. Then use this DOS-disk "formatted by Mac" in Atari ;-). The disk usually works 30..50% slower in Atari than disks formatted with FCopy, E-Copy, or other fast-formats - but at least you can be pretty sure that Mac will be happy with it.

The newer Macs work better with DOS disks. Some of the first models with the infamous "Superdrive", were very picky with what disks they accepted, and what not.

Just wondering here. I am new to the ST, just started collecting them for bands on our recording label. Funny that I am new to them, seeing that an Atari 400 was my first computer on my desk when it came out.

1.) When did Atari go under... and why? What happened to them?

2.) What FTP site can I download software... I know I can down load it to my PC and save it to 720k formatted disks with no problems for my ST (with DS DD drive)...

3) How much memory do I need to run MIDI seq programs... a 520ST enough, or 1040ST perfect....

4) If you ahave ST stuff for sale, email me....

otherwise, please post your answers.

Steve Found (sf@socrates.itl.co.uk) wrote:
: Tommi Pekka Hietavuo (gs01tph@panther.Gsu.EDU) wrote:

: I have recently bought an Apple Performa 475, (68040), 200MB HD, 20MB
: RAM and double speed CD-ROM for around 1200 pounds sterling. (is that
: around $1000). The equivalent Atari system (if there is such a thing)
: would have cost me a lot more. I already have a Falcon030 which I paid
: 1000 pounds for (about 2 years ago), the Barracuda or Afterburner would
: put the price beyond the Apple anyway without even looking at the extra
: hard-disk space, RAM and CD-Rom.

<sigh> Macs really seem to occupy this message area, perhaps because of
people getting Macs with MagiCMac... And I've noticed that those who do,
aren't generally very happy with "real" Atari computers. But you make
some good points, there's no denying that.

: The Falcon is WAY to expensive for todays market .... Would you really
: buy one now when you could get a Mac or Pentium for the same money. ?

For the hundredth time: yes, if I need one. And I do. If I wanted a
cheap computer, I'd buy a PC - or even a Mac, period. But if I want
more, I have to pay more. What "more"? More fun, more audio
capatibilities, more satisfying working environment.

As P.Saarinen wrote recently, for some of us, computers are not "just
computers" - and you take whichever is the fastest or cheapest. They all
have that special "aura" around them. And that's what often decides,
whether you're going to enjoy working with your computer, or not.

For some of us, those Pentiums and Macs are just not alternatives to
Falcon - no matter how cheap ther become... Sometimes you know what you
want, and get that. Sometimes that "something" is Falcon, sometimes Mac.

: I intend to use MagicMac on the Apple (to preserve my Software base)
: and ditch the Falcon some time soon.

Well, it's nice to hear that you will continue using Atari software. I
wonder, whether we should get a new message ares: comp.sys.mac.magicmac ?

Would that be useful to you, or anyone?

: Need to polish Vinyl-records (50's -60's).
: Using Falcon 030...
: Price: if professional not a big probleme (ca. 1000 $ but also more).

Now, THAT was a good question !!! There once existed a Mac-based system called "NoNoise", which used (now hold your breath...) MC 56001 DSP to remove scratches and noise from older recordings.

Does that bring anything to our minds =-) ? I've myself wondered for long, when the first Falcon-based systems like that will come to market! The program itself is complicated, I believe. The algorithm is very sophisticated and able to detect "unnatural" changes in sound data. There was a big, and very interesting article about the NoNoise system in Finnish HIFI magazine (sorry, don't remember when..).

We already have the hardware. How about someone porting NoNoise to Falcon? That should be possible. It might be a very useful program for us, who own old records - even for home use !

WinRec Pro (A German hard disk recorder), AFAIK, contains a simple noise reduction DSP modul already now.

: Please email: tweety@pmn.it

Sorry, but this is so interesting for many Falcon owners, that I hope we'll have lots of public conversation, too =-) !

Same here. Although this was about the time all the ST's simply stopped selling in my area, whereas 87 and 88 were good years for Atari at our store. Whether or not Atari was already giving up on the computer at that point seems too early to tell.

For example, had the XE started selling off the shelves when it came out, I'm SURE they would have extended it's lifetime too.

> In fact it wasn't really until the early nineties the decline started to show,

I started to notice it in about mid-89.

In a previous article, pgl@draco.bison.mb.ca (Paul Linton) says:

>Just wondering what your average Mega ST4 has to offer compared to a
>1040ST? Well, besides 3 megs more RAM. :) Does it have any new chips?
>What about an internal HD interface? Does it have the cartridge port so
>I can plug dongles into it?
>

The Mega ST4 has a "blitter chip" that speeds up screen redraws. It does have a cart port like the 1040, so no problem if you have software that requires dongles. You can hook up an internal drive if you get an ICD micro host adaptor (I think they still have some left). In fact, I have a Quantum 52 meg inside mine along with a Link 2+External Syquest. Obviously, the micro adaptor and Link 2 don't interfere with each other at all.

Otherwise I don't see any other major difference between the 2 machines. I think the keyboard is better on the Mega and the location of the floppy disc drive is more convenient. Also, the case design give more room for internal add on for later.

Source record: 165751

Hmmm, there does seem to be a problem with the truth statement. 1989 seems far to early for Atari to start having doubts about it's range of computers. Back in 1989 I was still at college using PC, most of which had 640K of memory and Hercules graphics, cards. Some machines had EGA graphics cards and the first VGA machines were starting to creep in but without any real support. Windows was unheard of and the PC were pretty plain business machines with poor graphics and bad sound (no sound cards worth mentioning back then).

For games and many applications the ST and Amiga simply left the poor PC for dead, making it look slow and clunky most of the time. This was back in 1989 when the Atari I consider had probably peeked with the ST and the decline was about to slowly start. Why then with would they think to abandon it when it was at it's best. Software support was excellent and the Amiga was its only real competition in the games market, the PC was becoming a standard but only as a business machine.

In fact it wasn't really until the early nineties the decline started to show, the PC took a couple of years for VGA to get the sort of support that would attract people and the processor speed to do anything decent. So 1989 seems to early.

Granted I could easily believe Atari did decide to change markets but not back in 1989, 1991/2 would sound more reasonable. If they wished to move into the console World then what product did they have? The answer is none. The Jaguar took 4 years to develop and certainly wasn't going to me marketable for any time soon. The amount of development costs that must have gone into the TT and the Falcon seem too great to be thought of as a stop gap.

Anway these are just my thoughts, but my main objection is not that Atari had decided to make a change in direction aborting the computer line, we know this to be true as we only have to look at the Jaguar, the problem is the date is just too unrealistic.

Yup....get it from umich.....

Actually, I think that there are two....one from about five years ago was just a c64 basic emulator.....I have a german one, I can do simple basic problems on it...it also recognises the floppy drive, so if you can get some simple progs on a 3.5" disk, things might work....from the way it starts up, it looks like a 68K version of x64, which appears to work well at uni (but is slower than the 64 emulator for the ST!!)

2595. WTB: DA's Layout CD English

Newsgroup: comp.sys.atari.st
Date: 1995-05-11 00:00:00 UTC
From: mtaylor@perth.DIALix.oz.au
Message-ID: <3osqdm$88v$1@perth.DIALix.oz.au>
Source record: 165753

Hello to all,

Well if anyone has the latest version of Digital Arts Layout CD DTP software with English menus etc for sale I am interested. I have been trying to upgrade my Didot Pro B&W for quite sometime to this but DA's Germany give me the complete runaround for the last 12 months or so. I do not need a manual so any German users might be able to help. I beleive the version released in Germany has various languages available from a pop up menu to convert the menus and help messages. This software is very good but the support offered by the UK distributor CGS Computerbild and the author company Digital Arts in Germany could only be fairly described as abysmal. So be warned if dealing with these companies as I have got the runaround from them for the last 12 months or so promising upgrades and it has cost me several thousands of dollars in lost work and costly delays to my customers.

Well if you can help me out please let me know. If there are any other disgruntled users of DA's software out there then how about letting us all know and we might save everybody else a lot of heartache.

Regards from OZ
Mark

2596. WANTED: STation for 520ST!

Newsgroup: comp.sys.atari.st
Date: 1995-05-11 00:00:00 UTC
From: bensmith@teleport.com
Message-ID: <3osfqh$r3b@kelly.teleport.com>
Source record: 165754

I'm looking for a piece of HardWare for my 520ST. It's made of Sheet Metal painted grey like my 520 ST. It has 2 compartments with room on the left hand Compartment for 2 Atari Drives with an open face for access. The Right Hand side has a closed face with room inside for your Power Supplies. It has a removable top so you can access your Power Supplies on the Right and remove the Atari Drives on the left. On Top their is room for Both a Color & MonoChrome Monitor. In the back, behind the Two compartments, their is opening for Cables to be strung from the Drives to the other Compartment for the Power Supplies. Also, underneath are 2 legs which raise the STation up so you can slide your ST under the STation. BTW this will work with a 1040 as well as a 520.

Please make all Replies in E-Mail to:
bensmith@teleport.com or for faster
service and/or if you can't reply in
E-Mail, call Ben (503)256-9974 24Hrs.

--Thanks--

: It seems like you can have 68040 accelerators to Mac for as low as $300
: (LC-version) ! Even full-sized 25..33 MHz 040 cards for Mac cost only
: $400..$600.

: Which raises one question:

: WHY does Barracuda-040 cost twice as much ..?
: and WHY does German Afterburner-040 cost 1500 DM (about as much)..???

: If this pricing strategy goes on, I may finally decide to agree with
: Mac-folks, and change the wagon. Owning an Atari should *not* mean
: paying twice too much for everything, IMHO >=-(!!!

: I also read that the accelerator market for Mac (68000-series) is
: declining fast, as people move to PPC. So, if they can sell 040s for
: $400, for example, I'd think a Falcon-accelerator might cost $600 at
: most! Something is wrong here... And it hurts us all.

: TH

I have recently bought an Apple Performa 475, (68040), 200MB HD, 20MB
RAM and double speed CD-ROM for around 1200 pounds sterling. (is that
around $1000). The equivalent Atari system (if there is such a thing)
would have cost me a lot more. I already have a Falcon030 which I paid
1000 pounds for (about 2 years ago), the Barracuda or Afterburner would
put the price beyond the Apple anyway without even looking at the extra
hard-disk space, RAM and CD-Rom.

The Falcon is WAY to expensive for todays market .... Would you really
buy one now when you could get a Mac or Pentium for the same money. ?

I intend to use MagicMac on the Apple (to preserve my Software base)
and ditch the Falcon some time soon.

This is actually a bug in MiNT. Even root should not be able to
execute a file that has no execute permission for anyone. I think
this is fixed in the current version of MH-MiNT.

Newsgroup: comp.sys.atari.st
Date: 1995-05-11 00:00:00 UTC
From: proche@isis
Message-ID: <3ot46v$6nr@imag.imag.fr>
Source record: 165760

Yes, I must admit that 1989 seems to be a little too soon for Atari to take such a decision. But you must consider 2 things:
1) From what I know, the ST line was not well sold in the US, as opposed to Europe where it was a big success. This could be a warning. I don't know what was the main concurrent of the ST in the US, probably the Amiga if it was the same as here, and certainly not the PC, unless the Tramiels gazed into their crystal ball.
2) You can't take the decision to drop a computer line one day and start producing something different the day after. If the Tramiels took this decision in 1989 (or 90 or 91) and had immediately stopped computer R&D what would they have sold until the release of their new console ? Soaps ? Shoes ? I don't know what is the time required to design a game console, but it certainely takes far more than a few months. And remember that they stepped back into the console market with the Lynx (it was in the beginning of the 90's, if I remember). From that point of view, 1989 doesn't seem too early.

A few questions remain:
-Why did the Tramiels take this decision ? Did they have so much intuition ? Were they scared ?
-Isn't the Tramiel statement destinated to hide the fact that Atari did nothing in time to make their computers evolve, relying only on the ST line, whatever the reasons are ?

question:
1.) When did Atari go under... and why? What happened to them?
Ric
Ras Dva Records

answer
Atari didn't "go under." The company is alive (but not well). They are still listed in the American Stock Exchange (symbol ATI). The company's headquarters is about a half a mile from where I am sitting here in Sunnyvale, California. Atari has all but dropped all development and sales of its computer line. Rumors have it that there still are limited numbers of Falcons and TTs being manufactured, mainly for development purposes. Atari's single biggest product is its "Jaguar" 64-bit home video game system. Rumor also has it that some companies like C-Labs have bought rights to the Atari Falcon design and are manufacturing clones. Today, Atari is strictly a video game company competing with Nintendo, Sega, 3DO, etc.

The Zip drive doesn't work with the Atari as is. Our usual SCSI
adapters do not work with it either. I comes with PC and mac software
only.
Even if the interface worked you would need to format the disk on a PC.

The best hope is that someone will write a driver so we can use it on our

parallel (?) port.

2608. Re: Zip Drive

Newsgroup: comp.sys.atari.st

The ZIP drive doesn't supply power to a connector pin which is normally powered with the standard SCSI interface. The atari (even with the Link)
will not recognize that there is a storage device on the SCSI buss so you can't talk to the drive.

(My understanding -- which may not be the correct reason but I know first hand that it doesn't work)

: 1.) When did Atari go under... and why? What happened to them?

Atari has never really "gone under."

Jack Tramiel bought bits of Atari from the old Warner org in July
1984. This was probably a major turning point for the company.... :-)

> C 5.

> Phil.

The "Use a 68881 FPU" option became available in Lattice C 5 (released in 1990). The compiler offered IIRC three options : use it directly, use the I/O based one in the Mega STE (or as the SFP004 card for the Mega ST), or "auto-detect" (use a real 68881, I/o 68881 or the standard no-fpu software).

Unfortunately, the maths coprocessor libraries were not available with Lattice C 5 (I used v5.06.02). If you compiled with a co-processor option enabled, you would end up with a "Missing Library" (LCM8.LIB, LCMA.LIB, and so forth) linker error. To get them you needed Lattice C/TT.

This changed when Hisoft released Lattice C v5.5. Maths coprocessor libraries were included in the standard package. (I currently use Lattice C v5.60 on my TT)

The prime reason almost no-one uses FPU options when compiling a program is : "Just how many people actually have an FPU?". Among Atari owners, the list is short : TT owners, ST owners with some of the early 68030 accelerators, Mega ST owners with the SFP004 card (rare!), Mega STE, Falcon owners who spent the extra to get one.

Unfortunately, Atari owners who are in the list in the last paragraph are in the minority. So, why bother spending a few hours more getting your program tweaked to use an FPU for perhaps two or three percent of your software market?

That attitude is just not right. Software should be written so that it runs on appropriate hardware, and if the machine has extra features, then the program can be made better/faster by using those features.

With a well designed system, the OS supplies "coprocessor emulation" if one is not fitted to the computer. If, for example, I ran a program expecting a 68882 on a computer without one, each time an FPU instruction was executed by the CPU, the CPU would "spit the dummy", and execute a piece of code known as a "Line F Exception Handler" (analogous to the

"Coprocessor Not Present" interrupt on "Intel Insane" PCs). This exception handler is the ideal place for an OS to put a "coprocessor emulator".

IIRC, Atari stuffed up in the original TOS version(s) by using the Line-F vector as a shortcut for a "CPU register-save", so "co-processor emulation" will not be possible on ALL Ataris. I believe TOS 1.2 or 1.4 was "cured" so co-processor emulation would be "safe albeit SLOW", but haven't been able to check this out. If only Atari had relased a coprocessor emulator or bundled it into a revised TOS version, we wouldn't need to have this discussion. (It would also prevent one thread in the atari.advocacy newsgroup - oops, I mean BobR vs "Sinflop" vs The_World vs Godzilla_And_The_Smog_Monster)

The point I was making was not that replacement file selectors don't exist,
but that the fact that they're so much rarer on the Mac shows that Mac users
are satisifed with their file selector. I am.

Uh, no.... You're still wrong.

The AV Quadras have a 40-pin connector called the "Digital Audio/Video"
port, which connects directly to the DSP, independently of the CPU.

I know of a scheme at src.doc.ic.ac.uk (mirror of atari.archive.umich.edu)
in the directory Portfolio (in the atari dir). It requirse fiddeling with
chips and wires though. The easiest thing to do os just hook the PF to a
PC in your neighberhood and do the filetransfers with the PC. I never
tested the Atari program, but it looked ok.
Good luck

2618. Re: atari to pc transfer

Newsgroup: comp.sys.atari.st
Date: 1995-05-11 00:00:00 UTC
From: BobR <76702.1466@CompuServe.COM>
Message-ID: <3orpkb$a7d$7@mhadg.production.compuserve.com>
Source record: 165776

> What programs will allow me to do this? I want to be able to read, format
> and copy to pc disks. Where can I find it?

A special program is not necessary to read and write PC formatted disks,
as long as the disks are formatted as 720K, Double Density.

The floppy disk format is almost exactly the same between the PC and the ST,
allowing you to do what you want to do, very easily.

The "trick" for best compatibility is to format the disk on the PC, again,
being sure to format it as a 720K disk (NOT 1.44 Meg High Density.. a standard
ST can't handle that format at all.)

There ARE kits to modify an ST to use 1.44 Meg drives, but they're not cheap.

BobR

2619. ST ahead of its time?

The LC475 is about 18 months old. The Quadra 630 is about 6 months old.
All PowerPC-based Macintoshes have 16-bit sound output.

>The Macs with DSP-processors were the AV-series. No wonder their DSP-
>chip was slow it wasn`t a Motorola DSP56001. :-)

Slow? The DSP in the Quadra 840AV (the AT&T 3210) ran at 66MHz and was
32-bit, as opposed to the 24-bit, 32MHz (I think it was 32MHz) Motorola
DSP56001 that was used in the Falcon. The DSP in the Centris 660AV ran at
55MHz.

>By the way, it's only the PowerMacs that actually are fast enough
>to do some realtime signal processing.
>040 Macs aren't.

Apple has all but abandoned 040-based Macs, anyway. The only 040-based Macs
left are the PowerBooks, the LC580 and the Quadra 630. By the end of the year,
Apple probably won't have any 040-based computers in its lineup any more.

From: cl152@cleveland.Freenet.Edu
Message-ID: <3osuvm$1sk@usenet.INS.CWRU.Edu>
Source record: 165778

I understand that these programs provide a SLIP link but for the last 2
they seem to be configured for the particular sever(demon) in the UK. Here
in NB, Canada or telephone company provides internet access but I require
a slip link with dynamic addressing. Am I right that the first 2
cannot be configured and if the last can be where can I get a version
that is intact with a readme file that actually applies to the Atari
version. If I am not technically inclined as is the case is all of this
hopeless?

Thanks

2625. How much is a Mega 2 worth

Newsgroup: comp.sys.atari.st
Date: 1995-05-11 00:00:00 UTC
From: brain@msen.com
Message-ID: <bxXilmoZj8XO079yn@msen.com>
Source record: 165783

I have someone here at work who would like to sell his Mega 2 machine
No HD, probably stock system.

Is there any book or files describing what reasonable sale prices
are for these? He wants to get a fair deal out of selling it, but wants
to get rid of it soon.

I would appreciate it if you could mail him directly, as he would know
most about the machine.

His address is:

michael_knight@compuware.com, or
michael_knight@ccmail.compuware.com

Also, since I am not too sure this will even get to the group, if you
wish to message me, you should probably do it in email. The reliability
of MSEN has taken a nosedive for the past few days. I hear a new
machine is going online, but I don't know when, if at all, I will
be able to read this newsgroup.

Thank you.

Jim

Falcon RS232 can go upto 38400 baud with no modification - all you need is software that knows about the Falcon. I connect at this speed on a 14.4 modem and get transfer rates of about 1.5 Kbytes per second (compressed files) and about 3 Kbytes per second for uncompressed data (like this news group).

If you can afford a 28.8 then go for it as the Falcon can use it.

Steve.

Pd> Motorola DSP56001 that was used in the Falcon. The DSP in the
Pd> Centris 660AV ran at 55MHz.

Although a 66Mhz 3210 DSP can hardly be considered slow, neither can it be compared accurately with the 56000/96000 range due to major differences in the operating principles of the chips. These AT&T's work out a bit faster than the 56000's but not nearly twice as fast - the pipeline is crap and the instruction set is a basic RISC structure. The Motorola range has a more specific design for signal processing than most competitors (generally, DSPs are just cheap, modified RISC chips) and are very much more efficient as a result. The advantage is that they don't need an immensely high clockrate to operate, and temperatures are kept low.

As for the 68040/DSP argument - I don't know a hell of a lot about the Mac's OS restrictions (other than things like the relocatable-code problem, which I think has been resolved with MagicMac) but I do know that the 68040 has the hardware multiplier-array, the RISC substructure and the multi-stage pipeline required for DSP processing, and can double up as a fair DSP (albeit - a VERY expensive one!) so the machine could certainly do it with a little bit of fancy code. The only restrictions would be due to interrupts responding too slowly, but this is unlikely on a 32Mhz processor with a fast, writable cache.

Pd> Apple has all but abandoned 040-based Macs, anyway. The only 040-
Pd> based Macs left are the PowerBooks, the LC580 and the Quadra 630.
Pd> By the end of the year, Apple probably won't have any 040-based
Pd> computers in its lineup any more.

Then maybe we can all get them cheap for our 'small' computers - they're FAAAAAAAST when they don't have a flabby OS to hold them back!

:)

Doug.

Thats much like mine - though I moved the ACSI drive into the SCSI bus
proper - and I leave my tape streamer disconnected. If you have a CD-ROM,
disconnect that too - as most vanilla PL5 kernels won't touch it.

> Also, with 0.9pl4 kernel, if I use the ICD software to run my hard

Don't use the ICD software to boot with - it won't work. Its fine for
formating and partitioning though.

> What I'm wondering is, since you've got the 0.9pl5 kernel to at least
> come up, how your configuration is different from mine, and what I

I've heard the kerenles from TSX-11 are broke. Mine was given to me - so
I don't really know a lot about it.

:-)

2643. Games: Substation

Newsgroup: comp.sys.atari.st
Date: 1995-05-11 00:00:00 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <3otqui$88h@golem.wcc.govt.nz>
Source record: 165837
Cross-posted to: rec.games.video.atari,comp.sys.atari.st

Well, Substation has been sent to most of the major Atari ST FTP sites so should be available if/when they get updated.

The game itself. Good sound, the stereo effects work really well, gives a better effect with speakers rather than headphones, there's a good feeling of knowing roughly where the monsters are, although that doesn't always help when they need several shots to kill and are hurling fireballs at you while you're shooting them.

The graphics are very bad. They should have not bothered with shading, and used the type of thing Wolf-3D has, simple block-mapping, gives a good impression of movement (which is a bit dubious when walking down a long hallway in substation, the shading flickering is the only indication). Obsession used far more than 16 colors, most of the time substation seems to have about 5 shades of grey and that's about it, with the occassional green, red, brown & yellow thrown in for monsters and items. The monsters themselves aren't too badly drawn, but not great compared to say thw quality of the ones in Dungeon Master.

Once you get into it though, you don't really notice the graphics, as the gameplay is pretty good, sneaking around corners hoping a stray spider doesn't destroy your last remaining bit of health, trying to find food or a better weapon (All I've found is the knife & pistol you start with and a sub-machine gun). There's keys to be found, secret areas (of which I've found 2, "UDS HQ" containing ever-useful food). I don't have a clue what to do with the bomb, the computer terminals or the crates in the medical centre... Just decoration?

I suspect the limit to the demo is no save-game feature (There'd better be one in the full version, as there's no mention of it anywhere), and what looks like a 20 minute time limit, which is an effort to get to, as the odds are stacked pretty highly against the player, although I haven't quite mastered this side-stepping business yet.

The demo itself contains no information on ordering the full version which is pretty pointless, but it's apparently roughly $25US, which is fair enough. If they had dropped maybe 5-10 frames per second off the 25fps speed, and improved the colors & graphics, then it'd look much better, as it is, 25fps wouldn't be too difficult, as it isn't moving a great deal of graphics around, the style Midimaze uses would have been as good if they put in distance-darkening.

The game itself is good fun, suitably difficult, fast & smooth, the sound is great, although the samples could have been clearer (the occassional bullet richochet is a nice effect), but the color scheme is what really

hurts the game, other than that, it's pretty good!

You DO however have the option of getting one of the many external
samling.playback cartriges, of which I would highly suggest the
ST Replay, or Stereo Replay cartriges...

On the other had, you can always just pick up a used 1040STe! ;-)

S > ClarisWorks will run on a one meg Mac Plus. As for
S > WordPerfect being full of bugs, and a pile of sh*t, I thought
S > that was the norm of ST software!

My, what a very intelligent piece of conversation.

Folks, don't be fooled - the majority of Mac owners aren't as pushy, rude, or downright abusive as this loser - in fact, Mac people in my neck of the woods have a pretty good regard for the ST's capabilities. Obviously this guy has mistaken his computer for his manhood - or suffers from a very bad inferiority complex to want to come here and call us all idiots because we're getting things done with our computers that aren't the same as his platform.

DNFTEC.

S > How is Doom II on the St?

Now why would I want THAT garbage on my ST? We're better off without mindless brute-force-and-ignorance games played by guys with no life. I've got better things to do on my computer - and don't want stuff like that cluttering up my hard drive that can be put to better use for things like MIDI sequencers, desktop publishing, telecommunicating, CD-ROM.....(yes, Sincrap, CD-ROM. Can even run Groliers on my STe now, thanks to SARA).

> I repeat what I pointed out to you last time : Jeff Minter is
> an freelance programmer who codes for the platforms he likes.
> By the way he is right.

S > Jeff Minter works for Atari. He is Atari's new wipping
S > tosspot!

Jeff Minter is one class act - unlike you. His games I WILL go out of my way to play. He's also pretty knowledgable, and a real neat guy. The fact that he lost it at you only shows just how abrasive a personality you are - getting Minter mad would be the equivalent of getting Mahatma Ghandi cheesed off.

BTW, so how's LLAMAZAP on your Mac? :)

> Consider yourself kill filed you sad, sad, pathetic little man.

S > Are you an angry ST owner?

Are you in any way related to that other sad, sad pathetic little man Roger W. Sheppard? 'Cause that sounds like a reply that stoops to his level - and is just as intelligent. The problem is

that who you're replying to isn't an angry ST owner - the problem is that you're an angry twit who doesn't have a clue who seems to delight in baiting anybody you think is smaller than you in order to boost what little self-esteem you have.

There's no room for bullies like you or Roger in this conference. So SHOVE OFF! And don't slam the door as you leave.

Nope. I see it (computer debating) like this:

Your neighbour gets a new telly. It's not the best
there is, but your neighbour feels it's OK for him/her. Now, you ring the
bell and tell he's made a wrong desicion. What makes you do that?

a) you want to do your neighbour a favour
(no, he IS satisfied, so don't create new needs for him)
b) you want to put him down, so you'd feel stronger
(I refuse to believe that!)
c) You want to make him buy the thing you've got, because if more
people own the same machine as you do, the more secure you feel
about your desicion.
(yep)

I think most of us fall into category c...

>>No a single one machine in the Macintosh family has a DSP-port. So, you're

>Apple's workgroup servers have the option of coming with DAT drives.

Yep, and in AV-Quadra's there's only route to/from DSP is a stereo
in/out connector.
I'm not talking about DSP. I'm talking about DSP-port, which connects DSP
to the *outside* world. Nubus is just a way to connect DSP to a Mac, there's
no DSP port there. Lack of eg. having digital I/O or way to do DAT-
backups via DSP (audio & data) is one thing that many Mac-musicians
ask for.

DAT-drive you're talking about, is SCSI DAT backup drive, that has nothing
to do with audio, SPDIF, optical I/O etc.

You can connect a DAT drive to any SCSI chain, also to a Falcon.
DAT drives are very expensive, compared to a normal DAT players (every
self respecting recording musician owns one anyway) which can also
play and rec ordinary music. That's why DSP port is so great.

What I'm saying here that Falcon's inbuilt DSP port makes many applications
and interfaces possible, that are not possible in a Mac without
expensive Nubus Cards.

2650. Harddisk or Papyrus problem?

Newsgroup: comp.sys.atari.st
Date: 1995-05-11 00:00:00 UTC
From: npetep@hasler.ascom.ch
Message-ID: <1995May11.061936.1730@hasler.ascom.ch>
Source record: 165844

I have on my Protar Profil 40 harddisk three partitions. On D: i have
I folder called papyrus. When I try to start the PAPYRUS.PRG in this folder
the following mesage appears "Daten defekt..." (datas are corrupted) and the
application cannot be started. After a couple of reboots it works finally.
This happens only with papyrus (until yet!). I tried already sveral things:
- reinstall Papyrus
- rename the old folder and install Papyrus again (so the new must be on
another part of the disk)
but i got the same result.

Is this now a problem of my disk or from Papyrus? What can I do?

I'm sorry, I have a Mac with System 7.5.1, and the Mac desktop (Finder) is
poor compared to Ease which I use on the Falcon.

>replacement desktops or file selectors, the simple answer is that the ones
>provided by Apple are so good that there is no desire on the part of users to

I disagree, the Mac file selector is moronic. YOu obviously don't know what
a good file selector can do. There are two commecrcial file selectors
available for te Mac. I use Super Boomerang which is very good. You seem to
think that the only thing I want to use a file selector is to copy files. I
want to remember regularly used path, files, be able to search for files and
more.

I suppose Steinberg's "Avalon 3" could do the job, if the errors are clear enough. I have asked this sort of manipulations (not realtime!) for Cubase Audio, but any DSP-coder out there could dig into libraries and put those known algorithms to work. There have been scratch-removal devices since 1980, so I suppose some code is available somewhere.

Steinberg have announced a ProTools 3 plug-in exactly for that purpose, but it is not available for Falcon Audio, unless of course we start giving them some pressure... :-)

Also "Sonic Solutions" mastering workstation can do all those things, but you'll get 20 Falcons for 1 such a setup.

>WinRec Pro (A German hard disk recorder), AFAIK, contains a simple noise
>reduction DSP modul already now.

Is there a demo available?

: annoying 'traits' it seems to have - like selecting a popup menu and not
: being able to cancel without selecting one of the options - all of which
: have damaging consequences. That really is incredibly bad design!

It is poorly designed. But on the other hand it does hold potential, I
mean if these bugs were to be eradicated it would be a quite nice program
wouldn't it?

: Why is the configuration so bizarre? Why does it crash whenever it feels
: fit to do so? Why does the 'active object' rectangle jump up & left when

The crash thing IS nasty. Plus it can't handle running POV 2.2 so you
have to quit out then use the command line or a batch program or something.
The other odd thing is that I can't seem to get it to LOAD a POV script.
Something I would have thought would be rather important. Also being
able to utilitise the POV character set would be nice too. I'm in the
processing of porting a program across from the PC's and Unix machines
that converts a True Type font into a POV include file, once its up and
documented I'll release it out. I've also found a program called MOV-POV
which is a very very nice program for generating the scripts required for
making POV animations. I recommend this, its on ftp somewhere.

: RayTech BBS (Raytracing support for PC/Mac/ST/Amiga/Arc)
: Falcon's Realm BBS (Falcon030 BBS, with TT & ST support)

Umm some numbers would be nice :)

One last little bug I've found in EB is that when you quit to gem the
windows are all tossed up, like you click on an option and it stays
highlighted and corrupts a bit... very odd.. maybe NVDI?

Source record: 165659

Hi All,

I'm having trouble getting Linux running on my Falcon 4/84. The
only installation guide I can find is for the Amiga. This is what I have
gathered so far:

* I need ataboot*.ttp, which is the bootstrap program
* I need vmlinux-0.9pl5, which is something really important
* I need a root partition for the Linux kernel, and a swap
partition, which should be ~double the size of my RAM. (So for me, 8 megs).

Those are the things I know I need. Those are the things that I
also have. These are the things I think I might need. Any help
explaining the following would be appreciated :) :

* A file called ram-filesys
* A file called root (root.tar.gz)
* A file called usr (usr.tar.gz)

I know where to get those, but I don't know how to install
anything. I can't help thinking there's some 2K installation guide
floating around somewhere :) I have many more questions, but this stuff
is step #1. Thanks in advance!

The Amiga Installation guide is sufficient. You need all the files you
mention here. Make sure the kernel you get does not come from tsx-11, but
from another place line ftp.phil.uni-sb.de/pub/atari/linux. Also look for
the ram filesys called new-file or something like that.

The process is very simple, only on the Amiga can they make it sound difficult:

1. Get a partition ready for Linux. This should be LARGE. See the Amiga
docs for info on partition sizes.

2. Get the kernel & bootstrap program decompressed and on a TOS partition.
Put everything in a directory called LINUX. CD into LINUX
Rename your kernel to VMLINUX.95. Rename the ramdisk to RAMDISK.FS.

3. Run ataboot.ttp. Give it the following paramters:
-k vmlinux.95 -r ramdisk.fs
This will boot the linux kernel using the ramdisk file.

4. Create the new Linux filesystem:
mkfs -t ext2 /dev/hda2

** EXPLAIN ON ** You will need to determine which device will be your
partition. This is easy. SCSI devices are called /dev/sdXY and IDE

devices are called /dev/hdXY. X is the unit number, where a = 1, b = 2,
etc. Y is the partition number, where 1=1, 2=2, etc. For instance, if
partition 2 of your first IDE drive is your linux partition, then your
device is /dev/hda2. If it is a SCSI device, then it is /dev/sda2.
*** EXPLAIN OFF ***

5. Make the mount point for the new system. It might already be there. Then
mount your new Linux filesystem:
mkdir /mnt
mnt -t ext2 /dev/hda2 /mnt

6. Make a mountpoint for your TOS partition and mount it:
mkdir /tos
mnt -t msdos /dev/hda1 /mnt
Remember the explination above of which partition Linux thinks your TOS
partition is.

7. Decompress the root.tgz which you put in the Linux directory in step 2:
cd /
tar -xzvf /tos/linux/root.tgz

8. Decompress the usr.tgz file which you put in the Linux directory in 2:
cd /usr
tar -xzvf /tos/linux/usr.tgz

This takes a while.

9. Edit the new /etc/fstab file. THE ONE YOU WANT IS IN /mnt/etc/fstab RIGHT
NOW!
vi /mnt/etc/fstab

Follow the examples in the file to add the /dev/hda2 device as the
root partition. Later you may want to mount your TOS filesystem as
well under /tos (I do this...Don't forget to create the mount point
for it!).

10. Type shutdown at the prompt to shutdown linux & reboot.

11. When the Falcon comes back up, run ataboot again, but give these
parameters instead:

-k vmlinux.95 root=/dev/hda2

Linux should come up from your HD. It takes a bit longer since it will
setup net routing and all that.

With the Amiga installation guide and some Unix knowledge, you should be able
to do this in one afternoon. It took me about 3 hours, mostly becuase the
5 meg usr.tgz file was corrupt after I downloaded it, so I had to download it
again.

Good luck.

2669. Re: MED/LOW RES emulator wanted...

Newsgroup: comp.sys.atari.st
Date: 1995-05-12 00:00:00 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HQFA3SH4GY8Y5841@SNYONEVA.CC.ONEONTA.EDU>
Source record: 165663

Hi.

There are a number of medium and low-res emulators available for the ST...

The ones that come to mind are the excellent EMULA series of programs.
These are shareware and could be found on virtually any good ST FTP
archive - especially the German ones like uni-kl.de, uni-stuttgart.de,
uni-erlangen.de, etc.

In my experience, EMULA seemed the most compatible (worked on both my
520ST and 1040STe) and stable. I was using its monochrome emulation but
I believe it also included a LOW RES emualtor version as well...

If you can find it - you might want to pickup a used copy of OMNIRES.
This was a commercial program that emulated both MONO and LOW RES color
modes. It worked pretty well but did work with STe TOS versions and
you needed to patch it to work on TOS 1.4, etc.

Be aware that no matter what emulator program you use - you can expect
your system to run as much as 20-30% SLOWER under emulation due to the
extra processing being performed (i.e. converting color to mono or
simulating greyscales when emulating color on a mono system, etc.).
Emula allowed you control the extent of the emulation (you could reduce
emulation quality to increase CPU time), btw.

Hope this helps...

Oh yeah, just because you get an emulator running doesn't mean every
program will work! Many games will crash because they directly access
the ST's hardware and interrupts whereas applications usually don't.
Also, emulation can consume a large amount of your system's ram - especially
when simulating greyscales, etc.

>Let me know, Thanks.
>BVM.
Well I don't know if DynnaCAD can show autoCAD *.dwg's. I am not sure if ANY
other program ANYWHERE can show AutoCAD proprietory format, but I use CAD
rarely (being a graphic artist first, and an engineer second) so I'm not
really UP on that stuff. I use a program called tbxCAD(the champagne of CAD
programs at a beer price - it's really quite good!) which can bring in *.dxf
files, which AutoCAD can export. DynnaCAD(an excellant program btw, expensive,
but it IS professional) should be able to do that much at least! If you do a
lot of CAD work I'd recommend an FPU (68882?)math chip or everything will be
too slow(this goes for any machine/chip that is used for CAD without a math
coproccessor)
ask Chris of ComputerDirect(Edmonton) at c.krowchuk1@genie.geis.com about
DynnaCAD or tbxCAD and your needs vis-a-vis *.dwg files.

I highly recommend finding a program called Diamond Format, its a stand
alone PD version of the disk formatter built in to Diamond Back, its what
I use for all my formatting needs on my TOS 1.0 machine. It can format
MS-DOS compatable 720k disks, and it can format extended format 82 track
10 sector disks, and if you have a 1.44 meg drive, you can even format
MS-DOS compatable 1.44 disks and extended format (82 track, 24 sector?)
disks!

Hallo,

>I have installed MiNT and MinixFS. It all seems to work fine. BUT, when
>I put an executable on a minix partition it executes even when the
>attributes are : -rw-rw-rw- (so no executable flag)!!

This is the normal behavior of MiNT. If you are logged in as the superuser, which is the default if you don't use a login package like mintos etc, you can execute everything. MiNT honours the executable bits only if you are _not_ the superuser. This is corrected, as far as I know, in MH-MiNT 1.12 pl3.

MfG, Ole

If someone is interrested I can send him a driver for Microsoft AND
Mouse-Systems mouses. This driver works fine with TOS, MagX and MTOS
on ALL serial devices like Modem1, Modem2, serial1 and serial2.

2681. SubStation Demo

Newsgroup: comp.sys.atari.st
Date: 1995-05-12 00:00:00 UTC
From: Conan Ford <ford@freenet.calgary.ab.ca>
Message-ID: <Pine.A32.3.90.950512203816.40027A-100000@srv1.freenet.calgary.ab.ca>
Source record: 165675

Well I was somewhat disappointed by SubStation judging by the Demo.

First off, good things. The sound is excellent.

A few things I didn't like--in the demo, at least, it is very dark. If you've ever played Doom II in the level with all the pits in the bottom (the Waste Tunnels), then you have a good comparison. Unlike Doom, where you can see most of the time, in SubStation it is very difficult to see. Maybe in the real program there are light-visors or something like in some Doom levels... Or a setting to brighten things (like in doom, the gamma correction factor). Or maybe cheat codes :).

In anycase the program is sluggish to respond. Also, when you turn around near a wall, unlike in some games you cannot really tell how fast you are turning, since the pattern on the wall is determined by how close you are (and if you're real close, it is just solid white).

One more problem: the X key doesn't slide left on my US keyboard. Hopefully there is a wy to select your keys in the real game.

But don't read this, download the demo and see for yourself.

2682. Falcon 030 Cache

Newsgroup: comp.sys.atari.st
Date: 1995-05-12 00:00:00 UTC
From: Terry.May@rebel.genesplicer.org
Message-ID: <848_9505121921@genesplicer.org>
Source record: 165676

I'm having a problem on my Falcon with the 030 cache going off and on at random. This is confirmed with at least three different programs, and is easy to detect by eye (and then confirm with a CPX) by how slow screen drawing becomes.

What is the likely cause and how do I fix it? And is there potential danger of corrupting data? So far I've not had any problems at all with data.

well i have three questions how much will it cost?
when will it be released?
where will i be able to get it from and
how can i obtain a demo version of either version 4
or one of it's predecesors?
thanks tim jordan

p.s i know that it was four questions but i got carried away

Certainly.

LocalBus, or to be exact, VESA LocalBus is an adaptor style for PC's that supports good throughput and allows reasonable graphics rates over the bus.

: seeing anything on the motherboard as to where this would connect to.

I have one of these boards in my STfm, it IS solderless to an extent,
uses clips and such, also requires you to CUT some connections and if
your video shifter chip is solered in will require you to do some
solering there too...

2688. how to optmimize USR 14.4K modem?

Newsgroup: comp.sys.atari.st
Date: 1995-05-12 00:00:00 UTC
From: hallvart@oslonett.no
Message-ID: <3ou3ss$d23@hasle.oslonett.no>
Source record: 165682

I'm not sure if my modem is set up to run at full speed or what...

I've got a US Robotics 14000 "Sportster" modem, and use it together with
"Connect" (which is a program I recommend for any Atari user with a modem!).
I just downloaded a file and saw that the speed was about 800cps- is this
normal or is it too slow?
If anyone out there has got their USR 14400 running at full speed and
as good as possible I'd like some tips and hints on setting it up.
Thanks.

I'm curious about the "auto-detect" case. Let us consider the case
of a floating-point multiply. Does the library multiply routine
have a three-way branch (depending on the type of FPU) to a line-F
call, an I/O operation, or a pure software multiply? If not, how
is it implemented? Just wondering.

Also, does gcc have a similar "auto-detect" feature?

2693. Who has the most sexy AUTO folder?

Newsgroup: comp.sys.atari.st
Date: 1995-05-12 00:00:00 UTC
From: cm3hirjd@bs47c.staffs.ac.uk
Message-ID: <3p02ci$m15@bs33n.staffs.ac.uk>
Source record: 165734

Okay so the subject might sound a little bizarre.. but I was just wondering who has the best collection of little tit-bits in their AUTO folder or installed as applications? My AUTO boots up with Stoop and then kicks in some basic Falcon fixes, then NVDI cranks into action followed by Freedom (a neato file replacement), Silkmouse (a nice mouse accelerator) and a DSP jpeg prog. ACC wise I have Rape the DSP which is the best module player for the Falcon, Freedom installed, XCP (of course) and MausWindow (makes your mouse pointer 'top' the window its over).

As for little programs laying around that are TTP's, heck there are loads. I can view just about any file image by clicking on it from GIF to JPEG to TIG to PI1, modules play automatically, FLI, FLC, FLH and MPEG animations boot up hassle free, text files get displayed, source code gets loaded and even my POV files raytrace themselves accordingly :)

So enough of this.. who else has some nice and nifty AUTO prgs or ACC's? The more fun the better...

Rich

You use the word 'rumor' quite a lot....

Sam Tramiel (CEO Atari Corp) STATED that they manufacture Falcons on demand.
C-Lab actually SELL a Falcon Mk II. (and are developing Falcon Mk II Pro.)

Atari are doing better now, and are beginning to make profits again (which they
havent done for a number of years) I believe.

2702. Okami_how2SOUP_OUT?

Newsgroup: comp.sys.atari.st
Date: 1995-05-12 00:00:00 UTC
From: miqco@sci.fi
Message-ID: <3ovdji$jib@tron.sci.fi>
Source record: 165743

Hello from Finland !

I'm testing Okami newsreader and it works wery well
untill I want to send replys.
When I'm creating replys with Okami and Oexport
it creates files ex. 23456789.H 23456789.X and
message.dat to MQUEUE folder.
Then I zip all these files and send my reply.zip
to host.
Then I tried to follow orders in HOW2SOUP.
1. cd (works ok)
2. unzip -U reply.zip (ok again)
3. uqwk -m -RREPLIES -BO (not working)
-there is no file called REPLIES, only those
I mantioned earlier.
-I tried name of each of these files instead of REPLIES,
it didn't work.
Whats going wrong ?

Orders to get mail works ok!

...I have to reply manually until I get this working.
But it's ok, I just use Okami to the point when
I should send my replys. Then I use my editor
and cut all non-relevant things from replys.
Save them as ascii files,and use my Hosts PINE
Editor to send them to addresses they belong.

I will register it (sure), but first I want some answers.

I found very nice program to use with POV (EB_EDPOV.PRG)
My problem with this program is that it is in French
language. Is there English version available ?
Also E-Mail address via Internet to the programmer/author
is useful.
Program is shareware and I will registrate it, but only
if I can understand what's going on.
I can't do it in French. And that's why I can't translate
resources to English.

> for a while. This is not the case with pre-emptive.

This argument will go away fairly soon. System 8 is "prepped" for pre-emption
and it's rumored that "System 9" will be fully pre-emptive.

Anyway, even in a fully preemptive environment like UNIX you can set the
process priority so high that it will essentially be hogging the machine.
The programs that don't do alot of WNE calls on the Mac are usually programs
that you're going to want to have hogging the processor anyway.

Just my $0.02

Hi -

I finally got my own 1040STFM after many years (I can still recall drooling over the ST stuff in 1985 issues of Antic and Analog).

Anyway, Way back then, Antic used to bundle a bit of a catalog with their magazine. I distinctly recall some sort of hardware/ software bit that would put out ST video and genlock it.

Does anyone recall what I'm talking about? Better yet, is there any video software/hardware currently available? I'd love to have an edit controller that runs on my ST.

Thanks!

Boy, did you get took. I just purchased a Quadra 630, 250 meg HD, 4
meg of ram (which didn't run anything but Quick Mail) and a very slow

system 7.something for 1000.00 U.S. from Government Services Agency
(I work for the Navy, Civil Service). It was bright and shiny at
first, but wait until you start trying to do with it what you
did with the Falcon, providing you can afford the software. Even
the 040 seems slow while decompressing .Tiff's and .Jpg's. Sure, its
a little faster but not enough for me to run out an get one for
home use. Mabey, MagicC Mac will only keep you yearning for your
Falcon when you try to run Apex Media. Oh, and don't forget a lot
of the "old" ST software that we all love is 'specialized" and
probably give you fits running under a system in a system, or
whatever. I'm sure that its is a great piece of software, most
commercial Atari software is,(most shareware too) and probably
the cheapest thing you'll buy for you Mac. I also have a
Intel Pentium 90 with 16 megs of ram (it needs more)(the Qudra has 32)
for two reasons. Auto Cad and Z-Max Optical design software.
The processor rips through the thousands (millions?) of numbers
in no time. But I don't use Auto Cad at home, I use (or will purchase)
Lexicors fine products (I think I can buy their entire line
and the Baracuda for the price of Auto Cad R13) and Apex Media.
(Don't forget the Baracuda's Video Funnel and SOB (DOS) emmu).
Sure, the Intel machines are cheap and faster than Dave Smalls
assembler in TT-Ram, but..... get one and set it
up, video, midi, com ports, dos (sob?), windoez (:(), the list
goes on. The botton line is you are what you use. The users in this
area are interested in THEIR Ataris and not your Mac's or PC's. Take
them and your comments to those groups, or even the Jag area, there
is plenty of flame there for you people. This isn't personal, I
drive Chevy's while you probably drive a Ford, I race Kawasakis
and you probably race Hondas, but lets talk about it elsewhere.

:)

Mike.

2707. Campaign Patch?

Newsgroup: comp.sys.atari.st
Date: 1995-05-12 00:00:00 UTC
From: dogmeat@netcom.com
Message-ID: <dogmeatD8G955.LuF@netcom.com>
Source record: 165748

All:

I bought a copy of the Atari game "Campaign" from Epic Software.
While the game is interesting, it does have bugs which crash my late
model 1040ste w/TOS 1.6. While you would think that frequent saves would
mitigate this annoyance, saves are impossible - all saves are recorded by
the game shell as directories and as such unloadable. But when I access
my desktop, TOS reports the affected files properly as normal files.

Wazzup? Is there a fix?

Atari did not go under. COMMODORE did.

>2.) What FTP site can I download software... I know I can down load it to
>my PC and save it to 720k formatted disks with no problems for my ST (with
>DS DD drive)...

One large site is: atari.archive.umich.edu however it limits the number of
anonymous FTP connects. If it disconnects you, you can try connecting to:
amiga.archive.umich.edu and don't forget: cd atari to get to the Atari
directories. The Umich site is also mirored around the world, so the files
are rather easy to access.

Perhaps the best Atari archive in the world is (IMHO) ftp.cnam.fr. Truly excellent!

Another top-site is ftp.uni-kl.de. Not to forget micros.hensa.ac.uk =-) !

Umich is o.k - but it's sometimes impossible to get there without a nuclear bomb. And it tends to contain older files then those I mentioned above.. Especially when we speak of German software.

Cheers!

: I also read that the accelerator market for Mac (68000-series) is
: declining fast, as people move to PPC. So, if they can sell 040s for
: $400, for example, I'd think a Falcon-accelerator might cost $600 at
: most! Something is wrong here... And it hurts us all.

Well, I use a Falcon 14/84/340/NEC3Xe/(soon Speed Res) at home, a 4/16/
240 TT (soon to be CaTTamaraned) and a '486DX2-80 16/240 at work, and have
messed with my boss's Performa 475 (read: LCIII 475, what a rip off!), and the
Performa's a joke! My Falcon with NVDI is about as fast as the Mac, my TT is
about as fast/soon to be faster than the '486. No thanks, the buzzwords of the
computer industry don't impress me. You can throw all the Megabytes and Mega-
hertz you want at an OS, but if it sucks, it sucks. They just aren't as
efficient as TOS/GEM (a truly integrated graphical environment).

BTW, try to get 800*600 on that Performa. Baa-haa-haa!!! Going for 1024*768
with the 40 MHz Speed Resolution Card for about $300-350. Already got 800*600.
True Color on a Performa? Yeah, riight. If there are any F030 owners interested
in an affordable upgrade to 2-2.5X F030 speed (faster than a stock TT) with
a Screenblaster-type upgrade integrated, e-mail at D.PHILLIPS25@genie.geis.com.

The version of Towers 2 on the ftp sites is actually the full version, but you can only progress through level 2 before you will need to register for the manual, (it contains the codes you will require to go further.

It recently received 93% rating in ST Format.

Review due in 3rd edition of Atari World.

We accept UK and Europe registrations - cost £19.95 inclusive

The docs only give the telephone number, therefore if you purchase by post the address is:

Tos/Gem is a pathetic JOKE! GET OVER IT! System 7 has more features and
functionality and is constantly being improved on. When was the last time
Atari updated the OS? Oh, Atari is out of the computer market. Real users
value apps and the Atari OS is not impressive.

This poster was referring that all ST's have DSP's and implying that the Mac does not have it as standard equipment. He was comparing a Faclon to an earlier Mac. There are more DSP/AV Macs on the market than Falcons..

This is absolutely wrong.

First versions of Linux were released in 1991. At least since the end of
1992, Linux has become an operating system for the masses.

BSD came out in the beginning of the 90's, too.

From: Desmond_Liu@mindlink.bc.ca
Message-ID: <70580-800409700@mindlink.bc.ca>
Source record: 165618

Has anyone successfully managed to use NVDI 3.01 and Stalker 3.02 together successfully? It works if I disable GDOS, but I want Stalker to use the monospaced PC_ANSI.FNT and the IBM{06,11,12}.FNT fonts in my GDOS folder.

Stalker does not seem to like NVDI's GDOS. I think I've seen this problem posted here before but I don't remember what the solution was.

I had the same experience earlie on, wiped out a disk of MOD files. :(
But as I think I mentioned before, find a program called Diamond Format, a
PD standalone version of the disk formatter built into Diamond Back. It
will format PC compatable 720 disks, Apple PC Exchange compatable disks (
same as PC format, just with a RESOURCE.FRK folder) and even PC and APE
compatable 1.44 disks, if you have the proper drive.

I think you wan't Apple's PC Exchange, which comes with most new Macs.
With this you could simply insert the Atari disk right into the Mac drive.

Shouldn't have any effect. The only "speed" difference was the addition of more "zooming" effects and a lot of colour 3D effects to the interface. Turning these off speeds the interface back up. Other than that, 7 is as fast of faster than 6 in just about all ways.

I think that was just a by-product of his idea. He didn't say the system "had" to use the Mac O/S. It sounded more like the machine would have the same abilities as the Falcon, which I do not think that Magic C will offer,to the greatest extent. But if the Mac compatibility is there, what the heck. If he developes it, why complain?

One problem with "3.1" is it's a different thing to different people.
To some, it's a s/w fix for a h/w problem, namely the latching bug on TT
cartridge ports. To some, it's System 7. To some, it's SCSI HD support
on TT's. To some, it's color support on TT's and Falcon's. Finally, to
some, it's eternal youth, eternal life, and a spot on "90210".

I personally own the Mac Emulator code which Gadgets by Small
marketed under a revocable, non-exclusive license. Similarly, Sandy owns
what she did. Hence, it isn't a question of 3.1 never being able to be
released because Gadgets by Small died last November; it is a question
of what I want to do with 3.1.

And I have to say, I'm not entirely sure yet. Sure, I'd like to
see it out in the world, going through school, getting married, raising
a family. On the other hand, there are significant steps to go through
in getting it out there.

* Beta Testing. Someone has to hammer on 3.1 *hard* and make sure
it doesn't break.

* New Stuff: We have to test things like 040 boxes and 48 Mhz TT's
for speed problems. Spectre 3.0 was susceptible to cache problems in its
opening menus, if I remember correctly. Extensive work has been done on
speed problems; it is rather hard to bullet-proof something for the TT
without slowing it down too much for the ST. I found a way. (I think).

* At the moment, here's the status of the UNRELEASED product:

- HDX 3-6 support is in, for BGM and XGM partitions. So you can
have REALLY big partitions and lots of them. Good thing
with hard disk prices at $200 for 540 megabytes.

- TT SCSI is up. The system will boot and run fine with SCSI and
ACSI partitions (although I don't trust ACSI on the TT...
I got burned that way.) You can have up to 16
partitions. If you need more... uh....

- Use of TT RAM has been extensively worked on, and portions are
in the code in MMU stuff, but is NOT up. I can't get it
working in GEM mode (TT mode) to debug it, either. There
is obviously something I don't know biting me.

- Color ROMS (256K, 512K, 512K-32-bit-clean) have been looked over.
This is a "Hmmmmmm...." project. The EMPLANT guys did it
with the Amiga. Can't say much more now,
but it will NOT be in 3.1.

- System 7.1/7.5: I know where 7.1 crashes and why (it really does
look to me like code to kill emulators). I can fix it, too.
I have been focusing on getting all memory sizes to launch,
TT-big monitor support, and whatnot before I tackle
that. I have done many similar things to a 7.1 fix.

One thing to remember is I *never know*, going in,
how much baling wire and bubble gum is going to be needed
to make a new Apple System go. Believe me, I look back
nostalgically at the Finder 4.1 / System 2.0 days ...
the ZeroStore handler has gotten awfully "special-case"
to handle this stuff.

- TT LocalTalk/AppleTalk: We worked on this a LOT in 1990/1991,
and it failed because the TT bus was running the SCC chip
too fast. The 128K ROMs used timing loops (gack!)
to "time" Appletalk. We did get it to transmit, finally,
but could not work out the receive framing.
Localtalk is, uh, complex... check out the books on it.
I'd say this has a lower priority.

Of course, I have to remind ya'll that Spectre, Spectre GCR, and
Spectre 128 were/are? registered trademarks of Gadgets by Small, Inc.
(Legal stuff.)

Perhaps the thing to do is rework this into an FAQ for Spectre
owners.

In any event, I'm planning on hacking on it tonight; one memory
mode comes up fine in 640 x 400 ST High, but not in TT High. I missed
a subtract somewhere, more'n likely.

Please note that anything I write on the Net goes to the folks
Gadgets was sued by (for example, Jim Allen was one of their "expert
witnesses").

3.1 is not ready for prime time, but a lot works, and a lot is
very close to working. What I need to find is a way to get Beta versions
out to people who back up their hard disks (listen, no joke) for testing,
and a way to talk with them about how it works. The old Beta test team
has all bought Macs and sold their STs! (Shall I bill Apple for royalties? :-)
)

I've thought I should release 3.1 for the TT hard disk/XGM support,
then beat on Sys 7, TT RAM, and so forth, in a later version (3.2 or 3.7).
I would welcome any comments on that! I'd *prefer* to "code for the customer"
than to guess and hope I'm doing what people want and need.

Feel free to email me at dsmall@well.com or dsmall@well.sf.ba.us
and tell me your thoughts. Let's not use up USENET bandwidth volunteering
for Beta testing, okay? (And think real carefully on that. We have zapped
out partition tables and stuff before during testing, especially on
exotic hardware.)

As for actually getting the code out, I imagine I can find an
anon/FTP site ... it's around 275K right now for the main program.
I'd *hate* to send that UUencoded!

Anyway, that's where things are at. I haven't "burned out and
faded away" (Neil Young). But I do need to hear from you what you're looking
for.

Also bear in mind that Gadgets owned the name Spectre. I won't be
calling it Spectre.

-- many thanks for reading all this chatter,

```
4 megs of RAM
TOS 1.4 (rainbow tos) in ROM
Mono SC124 Monitor 640x400 rez
Tweety board installed, but soundchip is dead.
Supra HD controller + case/power supply (along with a dead 80 meg mechanism)
TONS upon TONS of disks/manuals/software (this we got to talk about)...
Will throw in PAK-usable CPU chips....

It would make a cool junior computer. I had it running with MiNT 1.2
with full net/development tools. Quite a classic.

Send offers/Inquires to:

bpj@po.cwru.edu
```

Hi, I'm having trouble with a Gasteiner Top Link Host Adaptor I've just bought. There appears to be no power getting to it.

I presume it gets its power from pin 26 of the SCSI connector. (Terminator Power). My IBM 0661-371 drive is not providing this, so I hard-wired +5v to pin 26 (not into the drive of course), but I still have the same symptoms..wonky ST that is unable to read from drive A: correctly with the Toplink plugged in.

I know the drive is OK and the power supply is large enough to cope easily. The problem is still there even when the toplink is not connected to the drive (but still plugged into the DMA port).

Any ideas ? Also, does anyone know if and how I can get the IBM drive to provide terminator power so I don't have to hardwire it in.

Cheers,

Kev.

2746. Zip Drive Works On Atari!

Newsgroup: comp.sys.atari.st
Date: 1995-05-13 00:00:00 UTC
From: jperez@uhunix3.uhcc.Hawaii.Edu
Message-ID: <D8IEso.27n@news.hawaii.edu>
Source record: 165637

Well, I spoke with ICD today and the gentleman with whom I conversed has a Zip Drive attached to an Atari computer in front of him. He said he plugged it in and it worked on the first try. I was calling to determine whether SCSI Pro Utilities would drive the Zip. He said that ICD's software most certainly would, and that if there was sufficient interest in the Zip Drive on Atari computers, they would continue development to take advantage other features (and I believe, correct a problem with terminating power between the Link and Zip). There was mention that it may soon be possible to format over the protected cartridge which comes included with Mac and PC driver software. I think that means 2 carts will be usable for Atari users, assuming that a blank cart is included. In any event, I'll be picking one up for myself as soon as the local store re-stocks.

FYI: The Iomega Zip Drive is an external, removable media, data storage device. It is similar to a hard disk drive in capacity, allowing 100 megabytes of storage per 3.5 inch cartridge, which retail at around $20 each. Data transfer rate is reasonably fast (around 6-700kps), and I belive that the seek time is comparable to many CD-Roms (I don't know the numbers). At $200, the Zip drive offers a small portable high capacity storage solution. Equipped with SCSI-2, it is the perfect solution for Falcon/TT users (although not for digital audio recording) with teeny weeny internal hard disk drives. In addition, ICD engineers would like to provide a Link-SCSI interface, with terminating power so that it will operate between STs and Zip Drives.

If you are a Link/ST owner and have interest in using a Zip drive, contact them. If someone would be so kind as to post ICD's e-mail address, it would make it a lot easier to express our interest. Their phone number is (815) 968-2228, but try to use it sparingly, and only if you can't reach them in any other way (I'd hate for them to regret talking to a caller).

Aloha,
The Borg

```
: Does anybody know if a version of Word Perfect was ever released for
: the Atari.

"The Atari" is a broad term. It could mean:

The Atari 400/800/XL/XE line
The Atari ST/STe/TT/Falcon030 line
The Atari 2600
The Atari 5200
The Atari 7800
The Atari Lynx
The Atari Jaguar
The Atari Portfolio
The Atari ABC PC line

If you mean the Atari ST line, then yes. Word Perfect 4.1 was
released.

I've been looking at getting a Mega ST. There are a couple for sale here, and I'm just wondering what the going rate for one is?

One system is a Mega ST4 with a 60 MB Megafile and both monitors. It also has an upgraded mouse and software.

The other system is another Mega ST4 with mono monitor. $500.

So what's a fair price for these systems? I think $500 is a bit high. I was thinking of offering $400 for the first system. Keep in mind that they are in Canadian funds. So what do you think?

> Also, does gcc have a similar "auto-detect" feature?

It's not a compiler feature, it's a library feature. Gcc is not a
library, it's a compiler (actually three or four compilers in one).

I also doubt whether auto-detect should be considered a feature,
the detection code will take extra cycles, slowing down a system
with real coproc (the overhead is relativly large).

-k vmlinux.95 root=/dev/hda2 ro

The `ro' (read-only) at the end should always be there, in fact it should
have been the default to mount / read-only (as it is under NetBSD/Atari).

Message-ID: <01HQGIMDVU8I8Y57W9@SNYONEVA.CC.ONEONTA.EDU>
Source record: 165688

There are literally dozens of ST programs that can format MS-DOS
compatible 720kb disks. However, be careful about formatting disks
with extended formats (i.e. 10 sectors, 82 tracks, etc.) as MS-DOS
compatible! Simply put, some versions of MS-DOS aren't compatible with
such disks. In other cases, the PC's BIOS might not support these
formats or the PC's 3.5" drive might not be able to access more than
80 tracks. Extended disk formats ARE definately possible on the PC but
almost always MS-DOS will need a special device driver to patch the BIOS
disk-tables to read these formats.

As long as you stick with standard 720kb disks with no funny stuff, you'll
be able to transfer files between the PC and the ST just fine...

As for which formatter to use? Well, take your pick:

DC-Format 3.2
IBM Format
FloorMat!

Hope this helps...

>520ST motherboard as to where this XTRA RAM board could be plugged into.
>
>Does anyone have this board, and could they explain how it is installed?
>
>Thanks!
>

Well, I'm not sure if I have the same board, but I bought a "solderless" 4mb board from ST review about 18 months ago. The one that I have requires you to (I think - I'm speaking from memory) un-plug the video chip, and press in a board into the socket, then replug the chip onto the new board. There is another board which needs to plug into the mmu socket, over the chip. There is Then some wire-cutting to be done on the legs of some resistors (on the ST motherboard) and then some croc-clips are attached to other parts of the motherboard. I ended up soldering these in, for peace of mind. I had a few problems getting the ST to work after installing the board, but after a few splodges of glue here and there, a bit of un-bending of chip legs, a couple of broken needles stuck into the right places, and a great big fan wired up to the PSU, the computer works great. I paid 100 quid for my board, and I'm happy with it, however I wouldn't describe the upgrade as easy, and I'd reccomend you got someone to install it who knows what they are doing, Also on some ST's soldering is still necessary.

Steve.

David Small (dsmall@well.sf.ca.us) wrote:
: One problem with "3.1" is it's a different thing to different people.
: To some, it's a s/w fix for a h/w problem, namely the latching bug on TT
: cartridge ports. To some, it's System 7. To some, it's SCSI HD support
: on TT's. To some, it's color support on TT's and Falcon's. Finally, to
: some, it's eternal youth, eternal life, and a spot on "90210".

True. This is what I liked Spectre for, and why I wanted to buy it. I
did not understand why you did not answer any querries about the 3.1
version, I gues this had sth . to do with Apple. Anyway, this should be
resolved with thatposting. I have to apologize for harsh comments I made
before (sincerely).

: I personally own the Mac Emulator code which Gadgets by Small
: marketed under a revocable, non-exclusive license. Similarly, Sandy owns
: what she did. Hence, it isn't a question of 3.1 never being able to be
: released because Gadgets by Small died last November; it is a question
: of what I want to do with 3.1.

GO ahead. :-)

: And I have to say, I'm not entirely sure yet. Sure, I'd like to
: see it out in the world, going through school, getting married, raising
: a family. On the other hand, there are significant steps to go through
: in getting it out there.

In terms of MagicMac, an improced Mac emulatior for Ataris would mean
that Atari/Mac would become one plattform.

: * Beta Testing. Someone has to hammer on 3.1 *hard* and make sure
: it doesn't break.

Here I am. :-)

: * New Stuff: We have to test things like 040 boxes and 48 Mhz TT's
: for speed problems. Spectre 3.0 was susceptible to cache problems in its
: opening menus, if I remember correctly. Extensive work has been done on
: speed problems; it is rather hard to bullet-proof something for the TT
: without slowing it down too much for the ST. I found a way. (I think).

I will be posting that request on the MausNet, as there are, IMHO, more
"powerusers" in Germany with eagles, falcons, 040 cards etc. as in the US

: * At the moment, here's the status of the UNRELEASED product:

: - HDX 3-6 support is in, for BGM and XGM partitions. So you can
: have REALLY big partitions and lots of them. Good thing
: with hard disk prices at $200 for 540 megabytes.

: - TT SCSI is up. The system will boot and run fine with SCSI and
: ACSI partitions (although I don't trust ACSI on the TT...
: I got burned that way.) You can have up to 16
: partitions. If you need more... uh....

This is great news. Please, please, get it released.

: - Use of TT RAM has been extensively worked on, and portions are
: in the code in MMU stuff, but is NOT up. I can't get it
: working in GEM mode (TT mode) to debug it, either. There
: is obviously something I don't know biting me.

: - Color ROMS (256K, 512K, 512K-32-bit-clean) have been looked over.
: This is a "Hmmmmmm...." project. The EMPLANT guys did it
: with the Amiga. Can't say much more now,
: but it will NOT be in 3.1.

: - System 7.1/7.5: I know where 7.1 crashes and why (it really does
: look to me like code to kill emulators). I can fix it, too.
: I have been focusing on getting all memory sizes to launch,
: TT-big monitor support, and whatnot before I tackle
: that. I have done many similar things to a 7.1 fix.

: One thing to remember is I *never know*, going in,
: how much baling wire and bubble gum is going to be needed
: to make a new Apple System go. Believe me, I look back
: nostalgically at the Finder 4.1 / System 2.0 days ...
: the ZeroStore handler has gotten awfully "special-case"
: to handle this stuff.

: - TT LocalTalk/AppleTalk: We worked on this a LOT in 1990/1991,
: and it failed because the TT bus was running the SCC chip
: too fast. The 128K ROMs used timing loops (gack!)
: to "time" Appletalk. We did get it to transmit, finally,
: but could not work out the receive framing.
: Localtalk is, uh, complex... check out the books on it.
: I'd say this has a lower priority.

: Of course, I have to remind ya'll that Spectre, Spectre GCR, and
: Spectre 128 were/are? registered trademarks of Gadgets by Small, Inc.
: (Legal stuff.)

: Perhaps the thing to do is rework this into an FAQ for Spectre
: owners.

: In any event, I'm planning on hacking on it tonight; one memory
: mode comes up fine in 640 x 400 ST High, but not in TT High. I missed
: a subtract somewhere, more'n likely.

: Please note that anything I write on the Net goes to the folks
: Gadgets was sued by (for example, Jim Allen was one of their "expert
: witnesses").

Who is Jim Allen? Never heard of thies guy. So it was legal issues that
hindered Spectre 3.1 to be released.

: 3.1 is not ready for prime time, but a lot works, and a lot is
: very close to working. What I need to find is a way to get Beta versions
: out to people who back up their hard disks (listen, no joke) for testing,
: and a way to talk with them about how it works. The old Beta test team
: has all bought Macs and sold their STs! (Shall I bill Apple for royalties? :-)
:)

As I said, I theink there are ebough MausNET useres who would be willing
to do so.

: I've thought I should release 3.1 for the TT hard disk/XGM support,
: then beat on Sys 7, TT RAM, and so forth, in a later version (3.2 or 3.7).
: I would welcome any comments on that! I'd *prefer* to "code for the customer"
: than to guess and hope I'm doing what people want and need.

I would prefer exactly the same way. Howver, do include HD disk drive
support in the first version.

Regards,

Alfred

> newsgroup at all? Are they paid by some multinational companies to
> confuse Atari users? Is this conspiracy against freedom of choice?

No, no its much, much more worrying than that. They are modern day missionaries but rather than trying to convert you to the one true god they are trying to make us all worship the unholy trilogy of Apple/Intel/Gates.

We are, in their eyes, heretics and savages who know no better. However by giving in to them will simply make the world of computing a bland place to be.

> Thanks,

If you can get access to DOS mounter for the Mac then format a MSDOS disk
(720k), dump the software onto it on the Mac and then load it onto the
Atari.

AT LAST!! Somebody else who shares my attitude to life (or at least
computing) I use my Falcon for Net access and C programming and WP. It
suits my needs perfectly OK so its not a top notch whizzo multi-media all
singing all dancing microsoft compatable box but its FUN.

Like my car (a 10 year old Vauxhall Cavalier with 135,000 on the clock)
I'll use my Falcon till it finally gets to old to carry on but until then
its fun,fun,fun all the way.

> Also, does gcc have a similar "auto-detect" feature?

The startup code chooses which FPU is used (soft, I/O mapped, coprocessor).
I have built a SFP004 card and programs compiled with Pure C (or Turbo C)
detected the FPU. When I have put a PAK3 board (68020+68882), the same
programs continued to work (MiNT uses a FPU and it is compiled with GCC)

To : Robert Darling on 90:104/0
Subj: Nickelodeon is Closing

I am having to close Nickelodeon down immediately as I have been offered
the chance of a lifetime to live & work in Australia.

Contracts have been signed and I am off tomorrow for a few weeks to sort
things out.

I am sorry this is such short notice but I didn't want to say anything
until everything had been signed and that all happened within a day!

John Richardson should be in touch with you soon about WeirdNet and maybe
you might even get some of my nodes for NeST.
I'd like to personally thank you for your help and support and much more
your friendship and I hope, very soon, to be communicating with you again
from the other side of the world.

All the very best,

MARK.

Please note that mail to any systems under Mark's hub will not be able to
receive any mail now.

If any nodes/points off of Mark's system are reading this somehow and you
wish to connect to my system then please crashmail me a netmail and I'll
set
you up asap.

BeST Regards - Robert.

2765. MegaST2 Floppy replacement?

Newsgroup: comp.sys.atari.st
Date: 1995-05-14 00:00:00 UTC
From: csmith@callamer.com
Message-ID: <3p4qe1$25tb@pinot.callamer.com>
Source record: 165551

I've got a MegaST with a dead internal floppy.. Pretty damn dead, actually.

Now, since it's a 720k drive, is there any way I could replace this with
a much cheaper IBM 720k drive? Only problem I see is that freaky eject button.
Would it this work on any of the other ST's?

Thanks..
Chris

Now, is the Falcon 1.8 format using extra tracks, or extra -sectors-??

You realize, of course, that HD disks are -rated- by their manufacturers at
2.0MB?

And then there's the Amiga HD 1.76MB format that's been around for quite some
time.

Can you say, paranoia? Why would Microsoft ship their new software on 1.7MB
disks if was so wild & crazy? It's not as if they don't have -enough- bugs
to deal with. :->

This is actually happening while you're actually using a program (Desktop included)?

>What is the likely cause and how do I fix it? And is there potential danger of
>corrupting data? So far I've not had any problems at all with data.

I've no real idea, but I suspect that if the data cache is switched off
while data is in it, then the data will be written out to RAM since the
cache can be switched off at any time by the user.

>Falcon owners who spent the extra to get one.

I've not written anything that requires an FPU yet - I do have one in my
Falcon, but when'if I do I'd set Lattice to auto-detect and use the most
appropriate method for the hardware.

The auto detect routine is in the start up stubs with 'aut' in the
filename. I believe that Pure C can also auto detect the presence of a
FPU.

Exactly how this is done and how it affects the speed of using fp maths, I
don't know.

Phil.

Precisely.. When I was about to buy my Falcon, I had a lot of people (mostly PC spods, incidentally) saying about the low resale value. I was just amazed.. I wasn't buying the machine to simply sell it on, as far as I was concerned I was going to keep the thing until it finally breaks down on me.

I still get a lot of stick over my choice, but then I seem to do a lot more on my Falcon than some of my PC friends do on their 486's... Most of them only play Doom or F1GP, whereas I play LlamaZap, do all my WP and DTP stuff, mess about with Apex Media, do a little bit of programming, and more....

I was reminded of why I didn't like PC's the other day - I was at a friends house and they were struggling to set up a network of 3 PC's for a networked game of Doom... I left them to it after two hours! (IRQ's?? DMA??) On my Falcon I can do what I want a LOT simpler than with a PC. I *enjoy* using my Falcon, and that's what a lot of my friends just can't understand...

>dev. effort is now for Unix...)

Not entirely a surprise, is it? If I were totally happy with what
is available on UNIX boxes I wouldn't be porting a good text editor
to UNIX...

From the point of view of an average computer _user_, UNIX is a large
collection of useless rubbish. For the average UNIX program, one needs
to know how it could be written in C before one can really understand how
to use it.

Really? Both machines, also the 660 AV? And, is this port syncable to
48 kHz and 44.1 kHz?

Nope, I don't consider buying a 660 AV, it only has a maximum of 1 meg
VRAM.

Quite true, but I have never found it to be "sluggish", especially when compared to Doom on anything less than 486DX33 with 4MB ram on a largish level. (A hellofa lot more horsepower than the ST).
>One more problem: the X key doesn't slide left on my US keyboard.
>Hopefully there is a wy to select your keys in the real game.

In the docs it says z=slide left, x=slide right. This is wrong, \ (key to left of z) = slide left, z= slide right, also ins/clr (on cursor pad) slide to left and right.

I think it depends on what type, make, sex and date of your ST,

I put one in some time ago which did not take TOO much effort. Luckily my video shifter chip was
in a socket, and I did not have to do any major alterations, but as I said, that depends on your ST.

Unfortunately my case does 'curve' outward alond the F-keys a bit now! OH WELL, the extra memory is
worth it!

Good luck!

Source record: 165566

Hi All,

I have some upgrade questions. I'm transforming my Falcon into a Linux box, and I've come to the conclusion that my 4 megs RAM and 84-meg hard drive is not enough. I started looking at upgrade kits, and have a few questions:

* 14 megs of RAM sounds nice. I see here that Toad Computers sells a "14MB board" for $599. Is this the board, and not the RAM? I've never upgraded before, so I don't know. What does the RAM cost? And what does SIMM have to do with it?

* Compared to other upgrade options, the $99 PowerUp 32MHz is cheap. This is only cache, though, and really is not guaranteed to double my processor speed. Does anyone have this, who can say good things about it?

* I was thinking of getting BlowUp '030, but this won't do any good with Linux, right? Does anyone have this, who can say great things about this running with Linux?

* Now for the hard drive. Options, options, options! Toad also sells a 1.1GB HD for $619 (external) 8ms. I figure I'll get something like that, but has anyone seen a better price for one? Oh, and this is a SCSI drive. OTOH, I've seen a SyQuest removable external for $429, which reads/writes to 270MB carts. Good? Bad? Does anyone have one? It sounds convenient, but the carts effectively limit me to 270 MB, where as the gig allows access to a fill gig at a time.

* What's the diff between IDE and SCSI? I see a gig IDE HD for $399. SCSI is better, I think.

Well, that's it. Does anyone have better prices than what I listed? If so, let me know :)

Cue Rod Serling:

"Submitted for your approval - Roger Sheppard, a man who can't even remember who he posted to or what he was wibbling about, who mistakenly flamed at Maury:"

> Twit what facts that I posted that were not Correct...??

It was me who posted that comment, Roger...

And it was in response to someone who posted just what the MindSet computer was - a brilliant design, but flawed with a high price tag and poor DOS compatability.

This was the machine you said "that Atari should've released instead of that loser ST" (or words to that effect). Which would've been commercial suicide for Atari.

Which makes it ANOTHER thing to add in the text file called "Things Roger W. Sheppard is wrong about" - which is now approaching close to two megabytes :).

As for you calling anyone a "twit" - POT/KETTLE/BLACK.

"....but now, as you will see, as Mr. Sheppard continues in his one-man war against reason, against common sense, against proper spelling, he will soon come face to face to another reality - a reality that he will soon appear in alt.net.loon as their "Kook of the Month" - a reality found in - the Twilight Zone........."

> only.

It should work with the TT or Falcon SCSI adaptors - even if it doesn't
like DMA host adaptors much.

The software shouldn't matter too much. The drive *should* be implemented
as a proper SCSI device - so Atari driver software should be able to treat
it as an ordinary HD. Might need to reboot to change disks though.

> Even if the interface worked you would need to format the disk on a
> PC.

Quite possibly.

> The best hope is that someone will write a driver so we can use it
> on our parallel (?) port.

This is unlikely to work. The Atari doesn't implement the full parallel
port as found on the PC. This is why pocket LAN adaptors can't be used on
Ataris. Its going to be SCSI or nothing at all AFAIC.

Roland.

The checking is done 'on the fly' and has a noticable performance hit. It can be a useful feature - but for programs the *really* need the maths speed - then seperate binaries are a better bet.

:-)

Nope - this is the Mega STE.

The Mega ST is strictly 8Mhz only.

Roland.

Well said that man! The only worry I have is that you pitched it too high
for them to understand!

Steve - who despite sinclaps accusation that he is an angry ST owner is,
in fact, a mellow, cool, laid back Falcon owner

2788. Re: Games: Substation

Newsgroup: comp.sys.atari.st
Date: 1995-05-14 00:00:00 UTC
From: popemerlin@delphi.com
Message-ID: <JS-9rW-.popemerlin@delphi.com>
Source record: 165574

Substation

Storyline
In 1996, Mitushi Industries, a small Japanese industrial group, is researching alternative energy sources. What they come up with is so unbelievable it might just be possible.

Three years later, Mitushi's 'IEE' (Inside Earth Energy) base Substation at 2500 metres below sea-level provides Japan's two largest cities with all their power needs.

June 6th 2004, 11.15am: Contact with Substation is lost. In panic, Mitushi's Board of Directors pay the U.S. government an unknown amount of money to lease an 'M.E.M' (Multi-Environment Marine) to find out what has happened.

Visuals
SubStation is an incredible action game in which the player moves freely in an extremelyfast real-time gouraud-shaded 3D world. The screen refresh rate for the 3D world alone is an amazing 25fps (frames per second) in a resolution of 320*160 using 3 bitplanes.

The 3D system is a state of the art development solution written by Mikael Emtinger and Oskar Burman, and will make Substation one of the most technically advanced games ever to appear on the STE or Falcon.

Gameplay
Substation runs on any Atari STE 1Mb or Falcon with RGB or VGA monitor. Your cha
racter is controlled either using the keyboard or Jaguar PowerPad. You can run, walk, strafe, pick up items, choose between a great number of weapons, open doors, access elevators between the different sublevels and even strafe, rotate, run and fire your gun at the same time, giving you total control of your actions!

DD Audio
To further increase the horrifying atmosphere in Substation, Tord Jansson (responsible for the amazing sound routines in Obsession) developed a special sound effect system called DD Audio (Distance & Direction) which enables you to hear where monsters are lurking. The combined effect of foggy colours and pit-pat of tiny monster feet from the far left will give you nightmares....

MIDI-Link
By utilizing the link capabilities of Substation, you can play against other humans in special combat levels using the MIDI ports. Up to four players can take part in a game, either by forming two teams, or every man for himself... In MIDI-Link Mode you gain credits for which you can buy extra ammo, first-aid kits, food or new weaponry.

>devices and never had any luck getting the ST with a Link to "see" all
>the drives,

Bad luck for you - with non-faulty hardware and correct SCSI setup, this
combination does definitely work. One of my customers even has this running
like this:

ST -> Atari Laserprinter Controller -> The Link I -> Syquest SQ3270S -> Quantum
LP105S -> Maxtor 7345S.

Works and has ever been working absolutely reliable.
Of course, the Maxtor 7345S and its smaller brothers also work as the only
drive on The Link (_if_ you have it terminated and the "Termination power" and
"Parity disable" jumpers set.)

bye, Peter

>> with data.
PH>
PH> I've no real idea, but I suspect that if the data cache is switched
PH> off while data is in it, then the data will be written out to RAM
PH> since the cache can be switched off at any time by the user.

It doesn't need to flush the cache - the 68030 always writes 'through' the cache directly to RAM. Only the 68040 & 68060 chips have a write-cache capability and these do need occasional (partial) flushing, although the bus snooping feature takes care of this automatically.

On the 68030, the real damage occurs when the datacache-enable flag is set and the write-allocate flag is clear - this means the cache is not updated properly during writes and this causes lots of errors.

If something is messing with the cache, then there is a _slim_ chance this write-allocate flag could be changed, but the effects would be immediately obvious - CRAAAAASH!

:)

A member of our Tariland Computer Club has a Hwlett Packard Quietjet plus printer. It can support Epson and HP emulation. It is a couple of years old, so it may only be PCL4 HP emulation.

Unfortunately, this printer will not work with any of the drivers supplied with SpeedoGDOS 4.2 (or was 4.1? the version taht is supplied with Falcon030s anyhow.)

This is running on a 4meg Falcon030 with TOS 4.04.

Thanks a lot for any help!

2798. WTB: DA's Layout CD - English

Newsgroup: comp.sys.atari.st
Date: 1995-05-14 00:00:00 UTC
From: mtaylor@perth.DIALix.oz.au
Message-ID: <3p4mhi$bm1$1@perth.DIALix.oz.au>
Source record: 165640

Hello to all,

Well if anyone has the latest version of Digital Arts Layout CD DTP software with English menus etc for sale I am interested. I have been trying to upgrade my Didot Pro B&W for quite sometime to this but DA's Germany give me the complete runaround for the last 12 months or so. I do not need a manual so any German users might be able to help. I beleive the version released in Germany has various languages available from a pop up menu to convert the menus and help messages. This software is very good but the support offered by the UK distributor CGS Computerbild and the author company Digital Arts in Germany could only be fairly described as abysmal. So be warned if dealing with these companies as I have got the runaround from them for the last 12 months or so promising upgrades and it has cost me several thousands of dollars in lost work and costly delays to my customers.

Well if you can help me out please let me know. If there are any other disgruntled users of DA's software out there then how about letting us all know

and we might save everybody else a lot of heartache.

Regards from OZ
Mark

> 1.) When did Atari go under... and why? What happened to them?

This is truely the #1 problem facing Atari today.

As we all (or almost all) know HERE, Atari never did go under... but..
most of the rest of the world DOES think it did..!

From clerks at K-Mart to Editors of industry periodicals, no one knows
Atari even still exists.

When I asked at K-Mart why they'd dropped the 8-bit computer line (this was
years ago, when the XE was still being manufactured), I was told, "Oh, they
went out of business."

A few years ago, right in the middle of Atari's "big" Direct To Press promotion,
Computer Shopper ran a cover story about DTP on "all" the current platforms,
including the Apple II, for God's sake.. but not a word about Atari.

We've all seen similar omissions in recent Wall Street Journal stories about
the video game industry, and other "mainstream" publications like Video Review.

Contrary to some stated opinions, I don't believe it's a "conspiracy" against
Atari... it's just that no one knows the company still exists.

The fans and fanatics know about Atari, but the rest of the world has the
same impression presented here by the original poster... that is, if they
even have an impression left of Atari at all.

Jack Tramiel does not believe in spending money on promotion, and Sam Tramiel
made a personal plea to Atari User Groups to be "Atari evangelists" and
"spread the word" about Atari.

That question, #1, right at the top of Ric's list of questions is the result.

Yes, Ric... Atari still exists, although you'd be hard pressed to prove it
to most of the world.

You probably know this already, but if no one wrote replies like this one,
Peter Sinclair would probably become bored and move on...

I've noticed that pattern to the messages here and in other Atari newsgroups..
it would be no fun for him to twit the Atari owners if none of them bothered
to reply, and he'd probably just drop these groups...

> So SHOVE OFF! And don't slam the door as you leave.

If you really want to get rid of him, just ignore him...

> Sometimes I wonder, where the FUN has disappeared from computing...

Oh, I think it's still there, but you find it in different places now.

It's not the same as when you'd figure out how to make a 300 baud cassette
tape storage system run at 1200 baud on an OSI Challenger 1P, or the time
your first machine code subroutine for moving Player/Missile graphics on
an Atari 400 actually worked...

But I've been having a blast playing with GFA BASIC on my PC.. (yes, good
old GFA). I'm writing a little database to keep my music CDs straight,
and it's definately "fun".

One day I was bored at work, so I made an old PDP-11 ring all the bells
on the terminals attached to it faster and faster, then slower and slower..
drove the operators nuts... that was "fun" too.

I haven't figured out how to have "fun" with a Motorola VME based communications
proccesor yet, although putting one together can be sort of "fun"...

I know the feeling though... back in the "good old days" the "fun" from
small computers was a lot more intense. The days of discovery and
experimentation, and getting right down into a computer's most basic innards
was a real blast. You just don't get that much anymore.

Yup, confirmed that, too. Actually, the pl5 kernel built by Roman
Hodek has problems, too-- it corrupts my ext2 filesystems. I'm using
a pl4 kernel from a German ftp site. Running X Windows right now,
compiling "xv" in another window, and running "cu" to dial in to my
ISP. *Way* cool, even if it *did* take two weeks and two dozen trys
to set it up.

Steve, I agree with your points about the graphics. They should have kept more to the style of the original Wolfenstein 3D. It looks very dull and grey and speed is not that important IMHO. The monsters are not very well drawn either but gameplay is good. I think this game could have used a couple of more months polishing before release, graphics wise.

I'd get hold of a copy of 'Papyrus' instead, for Wp 4.1. is somewhat
outdated and Tempus Word pro is not available in an English version.

There are, I believe, two ST emulators for the PC; one is the Gemulator,
and the other is Janus. Both are hardware + software combinations,
comprising a circuit board and program. I think they are both still
current; if not, I daresay someone will advise.
I'm pretty sure that there is not an emulator for TT or Falcon; something
to do with too much processing power needed to get the speed.

As for "nostalgia clubs" I'd stand clear if I were you. The ST and the 8bit
are still both heavily supported by their userbase, and a very vocal lot
they are when anyone suggests that their pets are past it :-)

This is the regular ST/TT/Falcon group, similarly comp.sys.atari.8bit for
the various 8-bit models.

I think I've said this once already. NOS (and now Oasis, an alternative
shell for KA9Q) will do the job. And no, you don't need a Demon account;
just modify a couple of scripts (they need custom setting anyway).
However, as NOS cum KA9Q is set up for a PPP system, I don't know how well
they cope with a dynamic SLIP connection; if anyone else can help with
that, I'd like to know too.

Thanks a bunch

2812. UK Need HELP! dialing into Demon (longish)

Newsgroup: comp.sys.atari.st
Date: 1995-05-15 00:00:00 UTC
From: Rod <Rod@ivecoft.demon.co.uk>
Message-ID: <800532024snz@ivecoft.demon.co.uk>
Source record: 165504

Hello all,

Is there someone out there that can HELP ME!?
I've been trying to get a net connection going at home using my Atari / NOS.
I have been struggling for about 4 weeks (on & off) and have spent quite a
while on the phone to fellow Atarians comparing setups and files.
Last night I spent about 45 mins (ish) talking to Simon Moore who suggested
that I ask you for help. I'm not looking forward to the phone bill!

My setup is:- 1040STe with 4M RAM
Atari SM124 High res & TV monitors
127Mb hard disc
14400 US Robotics modem
TOS 1.62
MagiC 2.01
EASE 3.1
Fujitsu Inkjet
RTC clock module
NOS 0.41 (installed on E: in \nos)
Errors:- On selecting item A from the main menu (logon to Demon) the
program runs to the NET > prompt. press F10 and enter and AT is displayed &
OK on the next line but no dialing takes place. In fact the status lights on
the modem do not change at all.
I have used Connect to logon to BBS & similar services and even dialed into
the Luton VPoP without problems. So you can see I have something wrong in my
setup somewhere.
I have appended a copy of my dial.txt, startup.nos. tomshell.bat & mailer.rc
files.
I have been trying also to grab 0.42 nos but I seem to be missing some files
from the ftp dl. Lots of .c & .h files but nothing executable!?

Can anybody see what I'm doing wrong?
Thanks for any help that you can give

Files follow. The password has been changed to protect the guilty

ISTR asking Doug Little a question about how many Falcons he thought were
in circulation - it's his market after all. He said it was very difficult
to estimate. When his hand was forced he guessed at 12,000.

Was that right, Doug - coo-ee!

2816. New Falcon model out in June?

Newsgroup: comp.sys.atari.st
Date: 1995-05-15 00:00:00 UTC
From: ma2ljg@bath.ac.uk
Message-ID: <D8M8HB.EDt@bath.ac.uk>
Source record: 165508

I thought that you all might like to read this email I got
from digital Awareness (C-lab's UK distributor).
NB for those of you not familiar with UK slang a 'grand'
is 1000 UKPS or 1570 us dollars or 2270 german marks.

Date: Fri, 5 May 95 13:23 BST-1
From: Digital Awareness <digit_aware@cix.compulink.co.uk>
Subject: Re: Are plans to produce cheap Falcons?
To: ma2ljg@bath.ac.uk
Reply-To: digit_aware@cix.compulink.co.uk
X-Mailer: Cixread v3.5

C-Lab's license with Atari prevents them from selling direct competitors to
existing Atari models while they are still available. However, the Atari
machines are nearly exhausted now. I am going over to Germany on the 18/5
to spec out a cheaper machine which I hope we can show at the Spotlight
show in June. It will definately be under a grand. Watch this space (CIX)
for further details!

2817. Re: Truth about the "Truth"

Question time...

As most of us up-to-date-with-Atari-and-TOS-guys, know of GE-Softs Eagle computer. However, there are some things about it that I can't get any grip of.

1) AFAIK there will be at least one DSP card for it. Will it be Falcon030 compatible?

2) I've heard from several sources that a PPC card is under development. How will this card work, and what OS will it run? Will it be possible to run Atari programs on this card?
To put it short. I don't get it.

>
>Was that right, Doug - coo-ee!

In the 1994 march issue? of ST Review there is an interview
with Bob Gleadow where he 'claims' Atari had sold 80,000
Falcons in Europe by that time.

2826. FS/T: Atari 1040STf & SM124

Newsgroup: comp.sys.atari.st
Date: 1995-05-15 00:00:00 UTC
From: ebattalio@tamu.edu
Message-ID: <15MAY199520480910@vms2.tamu.edu>
Source record: 165518

All:

I have a 1040STf (sn: A1 69C 1011406) and a SM124 monitor
(sn N1581017736, manufactured August 1985) for trade or
sale. It works...played a Lode Runner clone on it yesterday.

I'd like to trade for 8bit Atari stuff, but will accept Apple
// and /// hardware and/or software or cash.

Trades will have priority, and shipping is negotiable.

Oh, it has the mouse and power cord. Both work.

Eric B.
ebattalio@tamu.edu

Well now I know Atari is still with us...

I like Atari very much. Had an Apple, like them too. Have a PC, like that as well. Atari was my first computer, and I am glad that this newsgroups is here... now that I have a few ST's here now.

thanks

Ric

2828. FOR SALE: Atari 1040 ST + a whole lot more!

Newsgroup: comp.sys.atari.st
Date: 1995-05-15 00:00:00 UTC
From: tmw@phoenix.sas.muohio.edu
Message-ID: <1995May15.195702.45334@miavx1>
Source record: 165520

```
FOR SALE:
Atari 1040 ST
Upgraded to 2.5 Megs of Ram
Built-in Double Sided Floppy Drive -- $200
Atari Color Monitor (SC1224) -- $75
Atari Monochrome Monitor (SM124) -- $75
Atari Megafile 30 Hard Drive -- $150
Spectre GCR (Mac+ Emulator that reads and writes Mac format disks) -- $150
Cordless Mouse -- $40
Forget Me Clock -- $20
2 WICO Joysticks -- $10
WICO Trackball -- $10
Timeworks DTP -- $20
Hard Disk Trubo Kit (Optimizer and Backup) -- $10
Replay 4 (Sound Digitizer cartridge) -- $20
Monitor Switch (Switches between Mono and Color and has Composite Video
and Sound out) -- $10
Word Up (Word Processor) -- $15
Gram Slam (Grammar Checker) -- $10
Lots of STart Disks (No Magazines)

Prices above assume I pay for packaging and you pay for whatever kind of
shipping you want (within reason). Prices are negotiable...I will accept
the best offer I receive.

Also, if anybody wants it all, the asking price is $600. Make me an offer.

You can respond here if you want, but it might be best just to send me
E-Mail....to conserve bandwith.

Source record: 165522

In article <3p02ci$m15@bs33n.staffs.ac.uk>,
Requiem <cm3hirjd@bs47c.staffs.ac.uk> wrote:
>
>So enough of this.. who else has some nice and nifty AUTO prgs or ACC's?
>The more fun the better...

auto progs:-

xboot.prg -- boot selector,
nvdi.prg -- nvdi 3 (sometimes 2.5) with 40 spd-fonts,
sb_auto.prg -- screenblaster 3,
gemram.prg and winx.prg -- for wonderful window handling,
letemfly.prg -- for flying dialogues and alerts, nicelines in menus,
chk_ofls.prg -- this is for use with Kobold,
ckbd.prg -- best keyboard driver ever seen for TOS,
dawnauto.prg -- Before Dawn screen saver,
drvin.prg and scc.prg -- serial drivers (HSMODA),
selectric.prg -- file selector (still my favourite - probably only until
freedom becomes an eCPX),

ACCs:-

XControl -- to be replaced with Space (hopefully soon),
1stGuide -- file viewer/player, understands VA protocol,
Before Dawn -- screen saver,
Clock21 -- analogue and/or digital clock in a window,
TakeOff2 -- popup menu for launching programs (VA protocol compatible
desktop replacement required),

auto start GEM application:- Gemini 1.a

When my Falcon has booted only 1,7 MB are left free... which is enough in
most cases.

...andf getting slower and slower and slower during the process. Have you
bothere installing System _6_ on an 840AV?

>When was the last time
>Atari updated the OS?

Last month or so. MiNT 1.12h3 is the recent version, AFAIK.

>Oh, Atari is out of the computer market. Real users
>value apps and the Atari OS is not impressive.

It's preemptive, close to POSIX standards and much faster than MacOS.

>Which Performa are you talking about? The Performa PowerMac makes your Atari
>look like the Atari 8 bit OS and Geos!!GET OVER IT!

Yes? My 8 meg TT w/WinX in ROM and 1 meg video board beats every Performa
in terms of operability. Not to mention that the only WYSIWYG DTP program
runs on Atari compatible OSes.

Yes, but there is special software supplied for write protect/write enable
changes and (AFAIK) some other things.

>The software shouldn't matter too much. The drive *should* be implemented
>as a proper SCSI device - so Atari driver software should be able to treat
>it as an ordinary HD. Might need to reboot to change disks though.

As Julian Reschke stated in Mausnet, the drivers currently available have
to be enhanced to control these critters. We'll see who is first to solve
this problem.

Hello,

I have a friend at Compo and he is considering working on a 486 hardware emulator for the Falcon. He needs as much info about the 486 series of chips as possible. I have posted to most of the ibm groups, but the backlog is unbelievable. There is a technician at Compo who is pretty in the know about the Falcon, but doesn't know much about the 486. If anyone can point me in the right direction I'd be very grateful.

Just to re-iterate, he reqiures full technical details.

Thanks.

Alan.

How about BIGCOLOR - a shareware package that emulates both low and med
res, using the whole high res screen area instead of just putting the
screen in a little box. You can find it in any good ftp site.

This makes me think, how about someone writting such an emulator tha
would emulate the screen in a window, so you could stay in high res but
have low res running at the same time. Is this technicaly imposesable?

Well, are you sure you supplied the correct parameters to oexport? There's
an option that makes it create SOUP-packages, but the filenames you mention
above are _not_ SOUP-files.

I don't know the correct options right now, but I suggest you take another
look at the oexport-manpage and try again.

Ciao

2844. Re: ST ahead of its time? (1.8meg format)

Newsgroup: comp.sys.atari.st
Date: 1995-05-15 00:00:00 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HQI5NHRPRM8Y58SM@SNYONEVA.CC.ONEONTA.EDU>
Source record: 165587

Hi.

Ok, regarding the Falcon's 1.8 meg disk format...

If you formatted a HD disk with 20 sectors and NO additional tracks
it seems that you would get a disk with 1.6megs of space:

80x20x512x2=1,638,400 bytes

From this it seems pretty obvious that you would have to use extra
disk tracks to get 1.8megs of space...

I agree with you (and others) that there's no problem with formatting disks
this way. Like you said, even Microsoft does it. And, like you said,
most disk vendors certify the unformatted capacity of a HD disk.

However, there ARE definate problems when you start formatting disks with
extra tracks. Among other things, data integrity is reduced due to the
weaker magnetic signature of these inner tracks. Even more important is
the fact that most HD disk drives found in today's PCs aren't tested or
don't reliably support tracks above 80, so a disk you create in your PC82
with 82 tracks might not be readable on a friend's PC, etc.
Another problem is that *some* HD disks, especially real cheap ones bought
in bulk might have some quality control problems that might cause
errors when extended formats are used. Finally, such extended formats
ARE NOT directly supported by MS-DOS and/or many PC BIOS's. Withouts
using a special device driver (as I'm sure Microsoft uses for their own
extended disk format) or patch to the DOS/BIOS disk tables, extended
disk formats can't be reliably used - hence, your friend's PC won't be
able to read your Falcon's 1.8meg floppy.

It may even be possible to get extra space on a floppy without using
extra tracks by using additional sectors. However, once you go above
20 sectors per a track, you start running out of available track space
not to mention problems with access speed and other track control structures
like GAPs, etc.

If you want to get more space on a Floppy without resorting to extra tracks,
how about finding a formatting program that will let you reduce the number
of directory sectors? You should be able to get around

Now, regarding my paronoia...maybe its because I smoke *way* too much pot! ;)

Seriously, I wasn't trying to say that extended formats were bad, rather I
was trying to point out some of the potential hazrds of doing so - ESPECIALLY
since the main reason of giving the Falcon a HD drive was to allow Falcon
users to easily exchange data with MS-DOS based computers...

Extended disk formats are certainly handy - I used them extensively when I
had an ST and no hard drive. However, I used them on cheap disks and
in some cases I had problems like not being able to use them on another ST,
a PC, or the disks just went bad...

I wonder if there really was a standard to include pictures in LaTeX
which are NOT in postscript format. Creating a document that includes
pixel graphics (e.g. screen shots for a software documentation) in
LaTeX is an awful task!

|> I really can't believe that there exists a "silver bullet" program that does
|> everything perfectly. I am happy if I have a good typesetting system which
|> allows to include pictures prepared with a good drawing program...

The way to include pictures in LaTeX is one of the system's biggest
disadvantage.

|> Besides, on
|> UNIX systems you can run several processes in parallel, so you can type your
|> text in one window and draw your pictures in another. Why should I need a
|> single program that is (only supposed to be) able "to do everything?

Under MagiC, you can run several processes in parallel as well. This makes
it possible to use e.g. papyrus and X-Act Draw "simultaneously" to create a
document. The striking difference to LaTeX is that you don't have to recompile
the text when you want to change the layout and that you can see what you're
doing. Especially when it comes to including graphics, an interactive word
processor/drawing program is much easier to handle than LaTeX.

|> Yet another point in favor of LaTeX and TeX (besides the excellent quality of
|> their output): they are free!

The current implementations of LaTeX on the ATARI computer line are cheap
(shareware), but NOT free (MultiTex is 75 DM, LindnerTeX about the same).

|> And yet another one: I have seen many people who
|> would not use LaTeX/TeX "because it is so hard to use" spending hours reading

|> the manuals of their word processor, e.g. in order to find out how they could
|> produce a table according to certain layout idea. They never succeeded...

If you had ever seen how easy it is to create and to _change_ a table with
papyrus, you would perhaps wouldn't have said this. I haven't spent more than
30 minutes to find out _everything_ about tables with this program. You can
create them within seconds, alter them and change their contents _interactively_, which is
a far better solution than recompiling the document. Tables were one
of the main aspects why I changed the system.
I have worked a long time with LaTeX and found it to be a powerful tool but
sometimes really awful to use, although I've been used to programming languages
since several years now. LaTeX is all but user friendly, especially in comparison
to a program like papyrus.
The only thing that really convinced me about LaTeX was the ability to handle
a mathematical formula. An important feature, but only for some of the users.

|> may suppose that their IQ is not that low, I could come to the conclusion that
|> what is called "user friendliness" of a program is not necessarily related to
|> "mouse driven".

This is right, but it also doesn't mean that "not mouse driven" is
a feature from which you can conclude user friendliness! LaTeX is
NOT user friendly, especially if you don't have the money to buy
a fast workstation to compile your documents!

|> If you spend the same amount of time on reading a wordprocessor
|> manual and reading a good book on LaTeX, you will be able to do much more
|> sophisticated things in the latter case.

Which "sophisticated things"? My opinion is that this is absolutely not true.
Talking about special features: LaTeX doesn't offer you scalable vector fonts.
papyrus and comparable WPs _can_ do this via NVDI3/Speedo5.

|> Oh, I forgot one last point: If there is something that LaTeX is not able to do,
|> you are free to add your own macros written in TeX. Am I right when I say that
|> if you are using a "normal" wordprocessor, you are limited to those features
|> that its developers have implemented?

How many average users are there who'd really spend the time to deal
with TeX and to write macros in TeX. Hardly anyone. LaTeX itself already
is complex enough.

|>
|> Regards
|>
|> Andreas

Some people say that common wordprocessors and typesetting systems like LaTeX
cannot be compared with each other. This is true, if you only regard the way
the system is built up. It is not true, if you ask what people are actually
doing with it: They write documents.

Christoph

There's BM2FONT, which converts all the pixel graphics you can name to
a PK font. Works great. And is portable to non-postscript printers.

>|> I really can't believe that there exists a "silver bullet" program that does

But it is the whole *essence* of TeX that you don't have to worry
about the way it comes out on the paper. Trust it --- probably don't
know half as much about typography as that program does. But I admit
that trying to include pictures is sometimes a bit of a pain. But
once you've figured it out for one picture, the rest is similar. I
never use anything else but LaTeX when I get the chance, and have
compiled some pretty complex documents with it. It's only in the
final stage that I regularly recompile and preview --- Just as it
should be. When typing a document, I'm an author, not a typrographer.

>|> Yet another point in favor of LaTeX and TeX (besides the excellent quality of

Use CS-TeX. That's pretty free.

[tables are easier in Papyrus]

I can't comment on this, as I've never worked with Papyrus. Tables
are pretty simple in LaTeX too, though. Even complex ones.

>The only thing that really convinced me about LaTeX was the ability to handle
>a mathematical formula. An important feature, but only for some of the users.

Including me.

Then don't. Type it in, and wait for the final stage to compile it.
If your docs aren't too complicated, two or three times usually
suffices. The whole *point* about LaTeX is that you don't have to
worry about the visual part.

>|> If you spend the same amount of time on reading a wordprocessor

METAFONT rings a bell? The fonts TeX uses are generated from vector
fonts.

>don't know.

I don't know either, but I would imagine (the most sensible way)
would be to put the detection routine at the very start of the compiled
program, and set a flag. Whenever a floating point calculation is attempted,
the flag is examined and the appropriate action taken. This would involve
minimal overhead, since the time taken by the floating point instruction
itself, whether emulated or done on the 68882, would be much longer. I think.

Does anyone know for sure? (Does anyone have the time to compile
a program and disassemble it? :-))

It depends on whether you are working through a host or a direct
connection. I you are on a direct dial-in, there's no reason why you
shouldn't use either NOS or Oasis; both are available from ftp.demon.co.uk
in the /pub/atari directory
They both use the KA9Q core, so should be ok. Certainly they work for ftp,
and the only time I've telnetted was to change a password.

> Godd for you.. Can't accept the truth can you?
--------------- CUT ------------------

Yes I can - the PC and Mac are, from a support point of view from major companies, better machines than the Ataris.
But _we_ are quite happy to carry on using our machines so how about giving up on your System 7 bible bashing and leaving us pathetic savages grubbing round in the dirt - We don't want converting thank you very much.

> Nope, you cannot accept the fact that the once beloved ST is no more.
> The ST has lost the price/performance for years as well as a decent
> software base.. GET OVER IT!

Have you _anything_ of use to put into this newsgroup or are you continually going to post messages designed purely to start a flame war. And before you say that all your messages are of use I mean messages giving advice to Atari users on Ataris (and not "Give up and by a Mac"). There are newsgroups specifically for having flame wars so how about going over there and getting on your soap box.

Just as an aside I see you are at a university : student or lecturer and what subjects.

Steve

I couldn't care less what machine you use. If you want to use an Atari,
why should I care?

I simply was responding to a post which contained some slight inaccuracies
regarding the original ST. I posted a few messages which mentioned the
benefits of standard human interface guidelines, and the Mac came up in the
conversation. I simply wanted to clear up some misconceptions about the Mac.
What computer you use is of no concern to me.

Yes, both the 660AV and the 840AV have this port.
I believe the DAV port can be synced to 44.1kHz and 48kHz, but I can't
confirm that off the top of my head.

In addition, the AV macs and the PowerMacs also have the "GeoPort" serial
connector, which is a special serial port. You can connect the GeoPort
Telecom Adaptor to it. It provides A/D and D/A converter circuits and
phone-line interface circuitry.

Of course you realise that it's a matter of opinion. My argument still holds.
The Macintosh file selector (or the Atari file selector) may not be your dream
file selector, but that doesn't mean everyone doesn't like it.

My argument against replacement file selectors was based only on interface
considerations.

I got the second copy of AW yesterday. I haven't had a proper chance to look at it in depth, but initial looks suggest this mag is just going to get better and better.

They say they had 1000+ survey replies in the first two weeks which shows some enthusiasm for the mag.

The main title feature is the Eagle, which gets a Buy Me rating.

BTW, have any subscribers got their prizes for being part of the "nifty-fifty" yet?

A couple of weeks ago I posted some info regarding the Mindset PC that was incorrect...

While in my college's library where I *should* have been studying for finals, my eyes happen to stray and find an old back issue of BYTE magazine which featured a review of the Mindset PC.

The Mindset was an MS-DOS computer that had impressive graphics capabilities but basically these capabilities were limited to 640x400x2 and 320x200x16 plus all IBM CGA video modes. The machine also had a strange PCjr like architecture that featured, among other things, two cartridge slots.

The Mindset was built by a small company in Sunnyvale, California and due to this fact and other similarities in the design to the ST, I believe some Mindset engineers were involved in the ST's development.

Well, this thread might not be all that interesting but it sure beats studying for my Stats final!

OK, so you're talking about the specific implementation of a general
local bus concept on the PC. Of course, the ST doesn't have a PCI or
a VL bus, but its own system bus. The graphics chip, however,
connects directly to the system bus. You can't get more local than
that!

When you run OEXPORT, remember to invoke the -S switch to create
a SOUP packet. Without the switch, O's output is in UUCP format.

2867. Setting up MiNT

Newsgroup: comp.sys.atari.st
Date: 1995-05-16 00:00:00 UTC
From: Auburn Placer County - Tahoe City <libaubt1@nic.cerf.net>
Message-ID: <Pine.SUN.3.91.950516190347.3596A-100000@nic.cerf.net>
Source record: 165460

Hi all,

I've tried my best to asnwer my own questions about this, but I just
can't make heads or tails of half the stuff I have on my HDD now :(

I got those 9 (!) MiNT installation disks from fpt.phil.uni-sb.de,
and found that the installation process does not work on my Falcon. I
had to manually un-zoo everything, and hack the .sys files to figure out
where things went. So now, I have \bin, \etc, \usr, and some others, and
thousands of programs in each.

The only problem is, I don't have many docs (they were't too good
about that part). So, I don't know how to set anything up.

I figure that I need tcsh, becase everyone says it's the best CLI
shell. I don't know the _first_ thing about tcsh, and my 'man' program
doesn't work (yet). Does anyone know where the docs are for this?

MGR also looked big, so I figured that was important. Do I want
that if I'm going to install X11R5? And, will X allow me to run GEM
programs? I'm not not sure of anything any more ;(BTW, I know I need
MiNTOS to run X (or do I!). MiNTOS scares me right now, though :)

Where is the 'official' documentation for MiNT? Not the
programmer's docs, (I have those), but the docs that tell me all the
great options I can put in my mint.cnf file?

Once I figure out where MiNT stops, and tcsh begins, and what X has
to do with it all, I'm sure I can figure out the rest of my thousands of
programs ;) Thanks for any help! How many other people are trying to
get this stuff set up?

Listen folks, I have a unique position when it comes to computer platforms. I happen to own a 2.5 meg ST, a 4 meg Falcon030, a 16 meg PowerMac, and I constantly "troubleshoot" PC clone problems for others.

I like my PowerMac for the simple reason it is fast, however, it is actually depressingly slow on file and directory operations in System 7.5. From what I understand, the PowerMac's OS is mostly in 68020+ code and is running under emulation with the PPC 601 RISC processor. I have waited over five minutes for Sys 7 to get its thumb out of its butt when openning a "suitcase" of fonts to just show the directory! Granted, the suitcase had a couple hundred fonts, but come on! I have noticed other extremely inefficient coding with regard to file copying. This doesn't matter whether I have my extensions on or off, it's still SLOW for most OS operations. Sure, PPC coded software blows everyone away in speed, but it lacks significantly when accessing the OS.

I have found that my measly 8MHz ST can read and sort a directory, copy files, and read and sort again long before the PowerMac has even started to read just one file! Keep in mind I do use MagiC on it. Window operations and all GUI related operations are much faster even with TOS 1.0 than on my PowerMac. Heck, my PowerMac only has cooperative multitasking, which uses emulated 68K code for task switching (SLOW!). My ST, with MagiC, is pre-emptively multitasked and runs extremely fast, and definitely task switches more efficiently than my PowerMac.

Sure, the Mac's have some nice hardware, but they do not have an OS that does them any justice. It is too inefficently coded. Also, I have not seen any software running on a Mac that could not just as easily by converted to run on an ST or even a Falcon. The GUI's are almost identical (with some exceptions). I have seen features on both platforms that are better than the other's.

The differences between a Mac and an ST are that business writes the software to get the job done and has many people hired to finish it as soon as possible for the Mac. On the ST, I have found talent and pride being put into software. ST programmers write programs that work very efficiently in as little space as possible, with as much speed as possible. Mac programmers put code segments together, with the segments (object programming) being very large and inefficient, to form a program that is sloppy, slow, and space hungry. No care or enjoyment is put into programming for the Mac. There's no time or desire.

Why? Well, any programmer that wishes to put out a particular piece of software for whatever purpose is usually stomped on by big business with their assembly-line programmers and advertising. It's the "why bother" syndrome. It doesn't encourage creativity. I have always found that ST

programmers have been the most creative and definitly show a love for what they do.

Sure, the lemmings of the world think they have it good with their fancy machines, but they have no understanding of what makes a great machine. Frankly, my favorite machine is my Falcon030. It's the most used.

That's my opinion

Rich

B> evangelists" and "spread the word" about Atari.
B>
B> That question, #1, right at the top of Ric's list of questions is the
B> result.

Here in Europe, the continent that has given Atari it's greatest support throughout it's history, they usually don't even include tha Jaguar in their roundups of the "latest and greatest" in the games consoles reviews. They're all talking about how great it's going to be when Sega (or is it Nintendo) come out with "the world's first 64 bit games machine. The national distributor for Atari here in Sweden won't even let go of review machines so those publications and television programs covering this sector of the electronics industry don't ever write anything about it. I'm not much of a console player myself (my business partner and I share a Jaguar which doesn't get used very often) being satisfied with the games available for my Falcon, but I certainly think the Jaguar deserves more attention than it's presently getting.

Needless to say, the computer side of the business is 100% neglected!! I run one of about 8-9 companies in Sweden that try to support the Atari computer platform and the ONLY support we've been offered by the distributor was a display stand for Lynx!! This despite that the name of my company is the Falcon Pro Center and that we're one of the (if not THE) biggest distributor in the country.

Lack of marketing support has *always* been Atari's weak point. If proper support had been given from the very start the Atari market wouldn't be in the state that it is today. Despite the snide comments made by two-bit idiots like SincLap in this area, the Falcon is a perfectly good computer that CAN do almost anything the Mac's can do and does SOME things better! Lack of support from Atari Corps(e) (or whatever name they're using these days scared a large number of developers away from the platform on the lame excuse that there was too much pirate activity. IMHO there is procentually less pirating done on Atari than on any of the major platforms it's just that there are so many more of the opposition machines out in the marketplace that it doesn't make as much of a dent in the publisher's profits. Thank God (or whomever) for independent developers that are continuing to provide us with high quality software both as commercial and shareware products. These are the people that ensure that there will be a following for our platform for a number of years to come.

The other thing that will keep us alive is the recent entry of third party hardware developers that are now beginning to introduce TOS compatible machines with higher specs than those Atari gave us. Ironically, it may be the Tramiel's exit from the stage that may save Atari for us.

Cheers,
Tom

On 14 May 95, sinclap2954 shot this through the ether to All ...

s> Which Performa are you talking about? The Performa PowerMac makes your
s> Atari look like the Atari 8 bit OS and Geos!!GET OVER IT!
>> Dan
>> : TH

I don't usually bother to write replies to these idiotic flame messages
but there are a couple of points to be made here.

Since this area is intended for Atari users who are perfectly satisfied
with
their machines (as you make it abundantly obvious as you are with your Mac,
which I might point out I'm not overly fond of) why the hell do you bother to
come in here to brag about your machine. WE AREN'T INTERESTED in your juvenile
comments. If you want to discuss the pro's and con's in a polite manner, I'd
assume you're welcome to stay but, if you haven't got anything _constructive_
to add to the conversation why don't you ride off into the sunset.

I've been quietly following your thread for a while now and it sounds to
me like you're trying to overcompensate for some feeling of inadequacy. Please
do this somewhere else. Why don't you wander over into that big cornfield next
to your school, pick a nice fresh ear of corn, sit and contemplate where you
can stick it!!

That's the last you'll hear from me.

Most of that 2 megs is taken up by FAT/Directory tables, sector headers,
etc, so you only end up with 1.44 megs of actual storage.

It was none other than Keith Sunderland who did write on 13 May 95 that ....
GI>>> GEMRAM(or ROSMPSEED) and WinX work perfectly well with 2.06 in
GI>>> fact there are some features of WinX that are only possible with
GI>>> the version of the AES that is within TOS2.06 ..i.e 3.40 IIRC.
KS> I am trying to use Terminate ATM as my power unit on the Atari is
KS> dead. When I revive it can I download TOS2.6 from somewhere and load
KS> it in with GEMRAM then? It looks like this is what you are saying?
KS> Thanks

I don't know if that is possible but I was refering to the fact that a machine
with TOS2.06 in chip ROM would be able to accept the WinX patch
and that some of the features of WinX require that TOS (the version of GEM
shipped with TOS2.06 to be more precise) or greater to work.

2889. Some GEM Programming Questions

Newsgroup: comp.sys.atari.st
Date: 1995-05-16 00:00:00 UTC
From: ee11cd@surrey.ac.uk
Message-ID: <3pb6ar$fb6@info-server.surrey.ac.uk>
Source record: 165482

Hi,

I'm a final year degree student and I'm writing a D2D package for the Atari Falcon. So far I've managed to implement the record & playback sections (I'm writing the editing part at the moment), however I have a few queries:

1. When I 'm playing/recording a sound file I display a model dialogue box to prevent the user from accessing any other part of the system. The reason for this is that during simultaneous playback/record, the timing is very critical - therefore I cannot allow the user to perform any other actions. I display the dialogue using the normal calls, except I use evnt_multi() and not form_do() for user input. The reason for this is that I want to stop playback/record whenever ANY key or mouse button is pressed (anywhere). Unfortunatley if another program's window is open (such as XControl) when this dialogue is displayed and the mouse is clicked on top of the open window, then that window is topped, and my program doesn't receive the event. How do I prevent this - i.e. how can I display a system modal dialoguebox that waits for multiple events?

2. Also, how can I detect if either mouse button (or both) is pressed using evnt_multi() - If I use the value 3 for the mouse parameter it still doesn't work.

3. How do I implement cycling of windows (i.e. using the CTRL-W keyboard short cut)? How do I know which window is the one that should be topped?

4. This isn't a programming question, as I've finished the record/playback section (apart from the niggles above) - I was thinking of uploading it to an FTP site so that I could get feedback from potential users (this would look good in my final report). How do I go about this - I've never actually uploaded anything - however I do have full internet access. Secondly, which FTP sites would be the best to upload it to?

Please send any replies to : ee11cd@surrey.ac.uk
- or - Craig.Drummond@ee.surrey.ac.uk

Thanks for any assistance.

Craig.

p.s. When I've finished the whole project I may upload the thing (executable, C-Source code, and -maybe- my actual report) - is anyone interested in this?

2890. BBS Software For The Falcon

Greetings from sunny Corbarieu, Rich,
I'm using an Alto V34 with a standard Falcon TOs 4.02, and a
Semper/jetmail/LED package without any problems. (HSMODEM 6 as well)
I average about 2500 cps and 24000 baud rates with 115800 DTE rates. No
problems encountered. Of course, I have to keep the modem's auto-answer mode on
all the time, as the Falcon's serial port "incoming call" wire is inactive.

I have the following items available for (hopefully quick) sale. If you
dont like the price please feel free to make me an offer.

ALL REPLIES BY EMAIL ONLY PLEASE

1) Microdeal Stereo Replay - 8bit stereo sampling/playback @44khz.
Complete with software (very good).
Sorry, no manuals or box, but very easy to use.
Price - 20gbp

2) NeoDesk v3 Replacement Desktop Software - IMHO the best available
(without changing OS) - Unregistered, with disks, box, manual.
Price - 15gbp

All prices are in UK pound sterling, postage is not included, and is to
be paid by purchaser.
Please mail me for any information/or price negotiation!

I am in London, England.

Adam Reeve.

If you'd like 0.42 ZIPped, UUcoded and mailed, e-mail me.
If you're really struggling, e-mail David Nash, the NOS maintainer at
<dnash@chaos.demon.co.uk>

Bugger; my new server's just done the "more included than new" trick on me.

While I'm here, you should be able to get 0.42 from Sounds Good BBS on
0115-955-4915; I think Paul should still have it on the system. If not, ask

him to call me and I'll reload it to him

I've been using 0.42 for a couple of months without problems (well, not dialling ones) <grin>. Once you get up and running, ftp to demon and get Oasis v1.1 if you can, else 1.04. It's 100% better than NOS despite using the KA9Q core.

best of luck

don't fret; this is to keep the server happy;

going

going

gone!

>init
>cwait 10000 "OK"
>cwait 45000 "CONNECT" "BUSY" "NO CARRIER"
>cwait 20000 "gin:" "NO CARRIER"

You're missing the command "dial", which should come immediately before the
line which begins "cwait 45000". You might still have problems with the
actual connection (or it may not be as good as it could be) - "AT" alone
isn't much of an initialisation string. Demon have a list of recommended
settings for US Robotics modems in the "modem.txt" file on their FTP site.

2898. Korg Editor/Lib for STe

Newsgroup: comp.sys.atari.st
Date: 1995-05-16 00:00:00 UTC
From: clark@ee.ualberta.ca
Message-ID: <3p8qud$1a40@rover.ucs.ualberta.ca>
Source record: 165536

Hey there kids!

I need a program editor/librarian program for my 1040 STe.
I have a Korg X5, and HATE editing sounds using a 2 line LCD
display! HELP ME!
A editor for the 05R/W will work, in a way, so that would be
nice too!
Any pointers or URLs to look at?
Thanks.

Try micros.hensa.ac.uk. MagiCMac is *not* Public Domain. It also is
not a Mac emulator - it is an operating system for the Macintosh
that lets it run Atari programs. It is related to the MagiC operating
system that you can get for STs/TTs/etc.

From: johnmoon@connexus.apana.org.au
Message-ID: <3pab59$36s@studioweb.com>
Source record: 165540

Just to let everybody know on this side of the world that a new Atari dealer here in Melbourne is now in operation.

Megatron Computer Industries
156 New Street
Ringwood, Vic., 3134.
61 3 9870 4017

They are selling FALCON, LYNX & JAGUAR. They also apparently have a large warehouse of spare parts as well.

In fact up until ATARI went belly up here in OZ, they were the official ATARI repairer here in Melbourne.

It looks as though they have resurfaced and now it makes them the THIRD Atari dealer here in Melbourne. 8-)

I hope Roger Shepherd is reading this!

Message-ID: <3paenq$mpu@aplcomm.jhuapl.edu>
Source record: 165542

I'd like to pass on the following Atari Hardware/Software system.

```
Item Date My Cost
-----------------------------------------------
Atari 1040ST/SC1224 color 12/86 925
Supra 2400 modem 4/90 135
Zram-440 4 MB 12/91 280
Supra 52 MB drive 12/91 400
200 3.5" DD/DS disks of software 400+
```

I invested $1740 plus into this system, but you can have it all
for just $200 plus shipping. The hard drive is worth that much!
Well ... maybe not, but this is still a good deal.

The processor is real flaky, good for parts.
Everything else is in good working order and in the original boxes
with manuals and stuff too.
The 200 disks contain both Commercial and PD software.

Total weight is about 40 pounds and contained in 4 boxes.

If you're interested, e-mail me at tcsmith@aplcomm.jhuapl.edu.

Thanks.

2905. Re: MED/LOW RES emulator wanted...

Newsgroup: comp.sys.atari.st
Date: 1995-05-16 00:00:00 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HQKJ0M791U8Y5CEC@SNYONEVA.CC.ONEONTA.EDU>
Source record: 165543

Hi.

Technically, its impossible for an ST or a PC to simultanously display two different graphics resolutions on the screen at once (like 640x400 or 320x200, etc.). To my knowledge, only hi-end workstations and the Amiga have the hardware support to do this.

However, the EMULA emulator has a scrolling option that allows you to emulate a 640x400 mono screen while in 640x200 color mode. The screen will simply scroll the screen vertically in real-time (not in a window). If this is what you mean then yes, its been done and it is possible on an ST. Its not as useful and one might think because the fonts and screen gfx are also 'emulated' i.e. appear as though they would in mono, etc. This makes the screen difficult to handle and view not to mention this option takes up alot of RAM (to buffer the screens)...

Another reason why I recommend EMULA is because it is compatible with TOS 1.6 machines, relatively fast (faster than SEBRA), and HIGHLY conifigurable in that you can adust things such as mouse response, processor time %, screen scrolling, colors, and the accuracy of the emulation.

Actually, this emulation is less irritating that the Falcon's faster but flickering hardware interlace mode...

Hope this answers your question...

HS> were in circulation - it's his market after all. He said it was
HS> very difficult to estimate. When his hand was forced he guessed at
HS> 12,000.
HS> Was that right, Doug - coo-ee!

That was a while ago, but the figure is unlikely to have quadrupled in the
interval...

Actually, this WAS a GUESS - and nothing more. Purely based on sales
figures, mailing lists, correspondence from Atari UK & Atari US and a whole
lot of other vague stuff.

My adjusted guess would be anything between 15,000 and 30,000 in Europe
alone. And not many elsewhere (Atari never pushed them in the States or
Japan, so I wouldn't expect large numbers).

But then again, that could be rubbish.

Regards,

Doug.

For which computer?

The ST and STE (and to some extent Falcon) has the Supreme Screen Saver by Douglas Little (it was on a STF cover disk a while back) it works real well. Or the Ultimate Ripper cartridge.

For Falcon there isn't much choice aside from Image Copy 3.5, and that won't get you the more tricky or interesting screens either (ie from a demo or game).

> Why don't people use programs doing what they *should*? Geez, People
> want a wordprocessor to draw pictures with, and a drawing package to
> edit texts with.

No, actually they don't. What the AVERAGE person wants is to make multimedia documents. LaTeX can't touch this, in this case I'll use your scarecrow and state that ClarisWorks can be used by a non-programmer/Unix hack and will do this far better thanm TeX could even consider. Don't bother trying to debate this, I used TeX to do my physics thesis.

The percentage of people for whom TeX is a better tool that Works because it does forumals can be counted on one hand.

> > Many other programs can.
>
> I guess *your* formulas.

No, I guess *my* _programs_ can. I've used FrameMaker, Mathematica and many other tools that are JUST as good TeX in terms of power and yet have a complete GUI. Anyone who thinks TeX is the best for formulas simply has NOT looked around the marker.

> more complicated stuff than " 1 + 1 = 2 ". Do you trust the marketing
> bullshit or do you trust an university full of mathematicians and
> physicists (and even computer scientists :-) all using TeX?

No, they all have large machine and think TeX is the only thing in the world. I know few physicists that even have anything more advanced than a 8088 on their desks in the office, and thus the ability to edit their files in pure text format to be fed into a TeX convertor is a useful feature.

On the other hand, the average user does not know how to program, and that's exactly what TeX is. For these users ClarisWorks and an add-on formula system does absolutely everything that TeX can do, much more, and it's all GUI based.

It depends on the room temperature too. When I was down at 18 centigreedes
things worked allright, but at a more comfortable 21 centigreedes, dropdown
menus started to change if I was using a lot of midi interrupts. Proflight
just bailed out and crashed (no pun intended :-)

As you pointed out it depends on the set up. I use it nearly all the
time on my Falcon. Once the initial AUTO folder .ACC problems were
solved its actually VERY stable. Indeed it crashes a fraction of the
number of times the WIN 3.1/NT machines crash here at the university.

Date: 1995-05-17 00:00:00 UTC
From: csmith@callamer.com
Message-ID: <3pcncv$tnb@pinot.callamer.com>
Source record: 165415

>Yep, it should work just fine, other than the custom faceplate. Actually,
>you could find an external floppy cheap and just swap the drive modules...

Thanks, also to everyone else that responded.. I procured a 1.4M PC floppy drive, and popped it in (of course, it'll only work as a 720k..for now). Next order of biz is to perform surgery on the Mega's case to accomodate the PC faceplate. Sorry purists,the central eject button just wasn't gonna happen on the PC drive.

Pretty cool for $0.00.

2931. Flash - HELP Please!

Newsgroup: comp.sys.atari.st
Date: 1995-05-17 00:00:00 UTC
From: narwhal@netcom.com
Message-ID: <narwhalD8q1JL.IIo@netcom.com>
Source record: 165418

I have an Atari 1040STf with a single disk drive. Up until recently I
was using Flash II as my telecomm software but due to my faulty disk drive,
which occasionally acts up (earthquake damage, long story), Flash II got
eaten.

So I ended up with a copy of the original Flash, the original telecomm
software I used...and it's actually quite nice except:

1. I can't seem to set it for vt100 emulation (as I could with Flash II)
2. It only has xmodem and a very primitive ymodem batch (Flash II had zmodem)

For now I d'loaded Uniterm, but really I do love the capture buffer on Flash.
If the two points I mentioned could be rectified in some way...that is, if
there is some sort of upgrade for Flash that could fix these things... or
if there is a telecomm program that I can d'load that is similar to Flash
but also has vt100 emulation and zmodem... I would be most pleased.

If anyone can help me, please either post here or email me at:
narwhal@netcom.com

Thank you!!

Narwhal

From: bign@fragile.termfrost.org
Message-ID: <3pd7at$920@echoes.Wittenberg.EDU>
Source record: 165421

After being without a color monitor for years, I finally bought a used one in canada. I was shocked at how small and crappy the resolution is. Now I only use the color (sc1224) for games and ANSITerm. The SM147 is used for everything else.

However, I'd like to have more than 2 colors at the 640x400 resolution. What graphics cards are available for the Mega4 ST and at what costs.

Source record: 165422

popemerlin@delphi.com wrote:

: Visuals
: SubStation is an incredible action game in which the player moves freely in
: an extremelyfast real-time gouraud-shaded 3D world. The screen refresh rate
: for the 3D world alone is an amazing 25fps (frames per second) in a resolution
: of 320*160 using 3 bitplanes.

extremely fast = yes
real-time shaded = you wouldn't know it
25fps = true, but so what when the screen is mostly pure white?

: The 3D system is a state of the art development solution written by Mikael
: Emtinger and Oskar Burman, and will make Substation one of the most
: technically advanced games ever to appear on the STE or Falcon.

STE perhaps.
Falcon, not a chance.

: DD Audio
: To further increase the horrifying atmosphere in Substation, Tord Jansson
: (responsible for the amazing sound routines in Obsession) developed a special
: sound effect system called DD Audio (Distance & Direction) which enables you
: to hear where monsters are lurking. The combined effect of foggy colours and
: pit-pat of tiny monster feet from the far left will give you nightmares....

Very true... effects are beautiful, creep up on you well and make the
atmosphere ooze.

: MIDI-Link

Can't wait to try it...

There is a free project from Germany called VOFA4000 which allows you to
put a graphic card based on the ET4000 chip from Tseng Labs (I mean a
PC-ISA card) into a MeagST or 1040STf. There is an address given where
you can buy parts or the whole project (the adaptator and/or the graphic
card). The software used is NVDI ET4000. I am building this project but
I can not go to work for the moment (my leg is in plaster) so I can't
tell if it works (I suppose it does). I don't recall the FTP site where
I found the project but it was in Germany (maybe ftp.uni-paderborn.de).

2939. Downloading Problem

Newsgroup: comp.sys.atari.st
Date: 1995-05-17 00:00:00 UTC
From: P.J.Groves@Bristol.ac.uk
Message-ID: <9505171934.AA19482@mail.bris.ac.uk>
Source record: 165426

I am having problems downloading binary files for my Atari. (Text files are OK.)

I use FTP either direct or inside Lynx. This gets the files (usualy *.LZH) to my account at work from which I then use Kermit in server mode to transfer them to my Atari for unpacking. Invaribly I get Bad Heading errors from UNLZH172.PRG when I attempt to unpack them.

UNLZH172.PRG works fine on *.LZH files obtained from Public Domain libraries.

I am setting file transfer at all points to binary.

I also had the same problem when I had a CompuServe account - i.e. when I was downloading by a more direct route.

Today I tried a self extracting *.TOS file, still without success !

What am I doing wrong ! Must I get all my files on disk ! HELP !!!

What type of Jags are they selling, PAL or NTSC Only read Atari agents can
sell the PAL versions, and from what I have been told so far there are no Atari
agents this side of the World.......

A Dealer is not a Agent....!!!!

> Including me.

And me.

>> may suppose that their IQ is not that low, I could come to the
>> conclusion that what is called "user friendliness" of a program
>> is not necessarily related to "mouse driven".

Absolutely correct.

As I have taken pains to explain in other groups, GUI and "easy to use"
are NOT at all the same. Just look at Windows Program Manager/File
Manager nightmare split up. Ease of use comes from standardization,
familiarity and data-as-concrete. None of these require a GUI.

In fact, the only thing I can think of that makes most tasks easier and
requires and GUI is WYSIWYG, perhaps rather relevant to this thread.

I'll take another tack now...

Would you use TeX to make a 3 page picture pamphlet? Probably not, it's
not what it's for. However, you can do this AND formulas in FrameMaker.
And a lot of other things too.

TeX, IMHO, is how computers USED to be. You entered arcane commands
into text files then submitted them to batch programs for processing.
Those days are over.

Maury

Source record: 165437

Hi there.
This is a desperate man, looking for help. I'm working most of the time
on a UNIX workstation and would like to use my falcon in the same manner.
But I need help with the setup, so if there are anyone outthere with a
falcon/Unix please help me.
Questions?
Unix has a different filesystem with longer filenames and extensions,
how to accomplish that?
How to set up TCSH, with unixlike filetree?
I would like to use following programs, how to get them and how to
set them up in a perfect way, GCC,emacs,latex?
If there is someone with, as far as he concerns, has a perfect
working environment,again, please contact me. I would like to see
the file tree with subdirectories and everything, also the resource
files belonging to the above mentioned programs.
Hope to here from you.

You do not need a standard, as long as you do not want to exchange
documents with other people wich use other machines.
CS-TeX allows you to put GEM-images or GEM-metafiles into you documents.
Did you ever try to use a Papyrus-document including pixel graphics
with other software (e.g. Works or Tempus Word)??

[...]
>The current implementations of LaTeX on the ATARI computer line are cheap
>(shareware), but NOT free (MultiTex is 75 DM, LindnerTeX about the same).

If you do not need the latest implementation - e.g. LaTeX 2.09:

CS-TeX is free!! It is AFAIK available via FTP at paderborn.de or
tu-berlin.de. And it is possible to use LaTeX 2e with CS-TeX.

>Which "sophisticated things"? My opinion is that this is absolutely not true.
>Talking about special features: LaTeX doesn't offer you scalable vector fonts.
>papyrus and comparable WPs _can_ do this via NVDI3/Speedo5.

Did you really work with LaTeX? I dont think so... because you can
scale TeX-Fonts at ANY size you want!

>|> Oh, I forgot one last point: If there is something that LaTeX is not able to do,

On 15 May 95, Christoph Oberle shot this through the ether to All ...

CO> The only thing that really convinced me about LaTeX was the ability to
CO> handle a mathematical formula. An important feature, but only for some

I'm not familiar with the Latex system in actual use, but I might point out that there _is_ a mathematical formula editor which can be used in conjunction with Papyrus. It's actually called formula and is a German product. The last I heard from Christian Nieber (the programmer of Papyrus) on the subject was that there were some plans to make "Formula" accessible from within the word processor itself. Even if this were not done it's quite a simple matter to edit a formula in "Formula" and import the results as an image into Papyrus.

le Rï¿½dacteur3, the French word-processor, had a built in formula editor which was a snap to use. Unfortunately, Rï¿½dacteur has/had several disadvantages compared to Papyrus. Among these were the lack of vector font handling and the inability to work with columns. OTOH, it is/was very fast and sported a built-in database and (in version 4) a spreadsheet.

You forgot Christoph Strunks TeX package which is the base of MultiTeX and
differs IMHO not too much from it. It _is_ PD and available from different
ftp-servers.

> handle
> a mathematical formula. An important feature, but only for some of the
> users.
You can still use LaTeX for the formulas and print them as an IMG file.

> Talking about special features: LaTeX doesn't offer you scalable vector
> fonts.
> papyrus and comparable WPs _can_ do this via NVDI3/Speedo5.
But the quality of scaleable vector fonts is not as good as one font for each
size. (Ask your next typesetter :-)

And there is another big advantage while writing documents with LaTeX: You'll
get a "feeling" for typesetting. If I compare my first documents written for
the university using Signum!2 (years ago...) with the way I write today I can
see a big advance. If you use a WYSIWYG system like Signum! or Papyrus you get
in danger of "playing" with the text and the pictures. And the result looks
mostly really awful. Using LaTeX you'll never have these problems - it's to
difficult to do those things :-) As I said before, now do I use Papyrus but I
am aware of the mistakes you can do to the layout. (Well, I think I am aware.
Perhaps a professional would still begin to cry seeing my documents :-)

Here at the university all students use Word 6 and when our group wrote an
essay I had really difficulties to keep the document "clean" and straight. They
wanted to change the font and create silly frontpages. In the end I gave up...
(Not only due to my friends but also due to WP 6 :-)

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I'm searching for a new 1Gb SCSI drive for my Falcon.
The following questions have arisen:

1. Is SCSI-II the same as FAST SCSI-II ?
2. Is anyone out there using an IBM SCSI-II drive(s) with their Falcon
(= do they work with a Falcon, are they good?)
3. Are Seagate Hawk drives really "second class" as some dealers say?
4. I recall once having a TOS-Magazin -program for testing hard disk
performance (with graphical output). If anyone knows the program,
please point me the ftp-site, or if you're really cool, uue it to
me. That program was the only one that gave a graph of the
drive's calibration interval & lenght, and that's something I have
to know before buing a drive.

Thanks.

Yes, after a few hours it gets hot enough to boil water (I put a few drops on it
and they sizzled!) and burns to the touch, but I've left mine on for a month with
no problems.

All you footbal-game fans with 1meg STes or Falcons, check out this demo of the game "Team" from Impact software, very impressive, it uses all the enhanced features, has brilliant full-stereo 50Khz intro music (which I can't rip out properly :) Uses full overscan giving some crazy resolutions, extra colors, blitter. The field scrolls amazingly smooth, and the gameplay looks similar in quality to Kick Off 2 or Sensible Soccer. Pretty impressive stuff!

Now, if only I could work out how to control these soccer games, they're damn near impossible, Speedball 2 I can manage, but controlling soccer games is a lot more difficult than playing it for real!

Aaargh! `Multimedia documents'? What's that supposed to mean?
Documents with audio and movie fragments in them? I can't speak for
`the' average person, but most people I know write documents because
they have something to tell --- whether it's some kind of a report or
a scientific article.

> The percentage of people for whom TeX is a better tool that Works

>that's exactly what TeX is. For these users ClarisWorks and an add-on
>formula system does absolutely everything that TeX can do, much more, and
>it's all GUI based.

Is LaTeX really _that_ hard to learn? Okay, it *does* take a long
time to get used to it, and I would certainly not recommend it to
someone who just wants to write a simple letter.

One other thing is that the quality of texts produced with TeX is
really outstanding, typographically speaking. I have not seen any
other wordprocessor that can match. How many wordprocessors
automatically apply ligatures? How many even make a difference
between hyphens, en-dashes and em-dashes? How many have the
excellent hyphenation algorithm that TeX uses?

Note that I'm not asking for examples (`But WP 6.0 *does* add
ligatures!'), I'm saying that the emphasis is shifting from
readability and typographic correctness to flashy, `multimedia'
documents which is nice for adverts and posters but gives me a
headache when I try to read them for more than two pages.

And the worst thing is, nobody seems to care. When I try to explain
to someone what a ligature is, I pull out a book from the shelf and
try to show him one --- but most books nowadays _are_ made with crappy
wordprocessors and thus don't even contain them! Very depressing...

Well SubStation is a good game for STE-owners - not more.
I've also tried it and my impression was that the sound was good and
the gameplay was good too (and fast, at least on the Falcon), BUT the
graphics were very disappointing in a Falcon-perspective.
Yes, I know that the STE can't do much better, but it would have been
cool if there had been a special Falcon-version of SubStation.

If a Falcon-version appears - I'm definitly a buyer.

Keep Cool and Flying...

I recently bought a 1040ST and have had no complaints about it. Unfortunately, after downloading EVEREST (ever_e_33.tos or something like that), some of my TEXT files are "screwey". For instance, in some of my files there suddely appears a line that has JUST the filename I am editing in it. It erases everything else and is messing up my work (C programs). I have TOS v1.00 (I know, I know, but I hope to get it upgraded this week or next to TOS 2.06), no HD, 1mb RAM, basically your standard run-of-the -mill 1040ST. I've tried it on both MS-DOS formatted disks and ST formatted disks to no avail. PLEASE HELP IF YOU CAN!

> FPU.

AFAIK the Pure C library detects an I/O mapped 6888[12]. To use a real
coproc, generating inline F instructions, one of the compiler options
must be set (similar to the gcc m68882/soft-float options).

> Exactly how this is done and how it affects the speed of using fp maths,
> I don't know.

I suppose that the overhead of testing a flag, which indicates whether
software emulation or an I/O mapped FPU must be used, is acceptable.
But if there is a real coproc in the system, the overhead would be
relatively expensive, and there is also a problem with optimizing the
code. An 68882 is capable of overlapping arithmetic operations with
certain types of FMOVE instructions, a good optimizer will rearrange
instructions for maximum concurrency.

From: fvdakker@sterbbs.nl
Message-ID: <7858-27697601@sterbbs.nl>
Source record: 165302

I'm trying to connect my Falcon to Internet with KA9Q/NOS.
After I solved the problem of not being able to attach the
modem (solved with HSMODA), I can't get the ting to work with dinamic
IP-adresses.
Also I got the most recent version I could find on the ftp-site
disabuse.demon.co.uk, I think it was 0.42. I combined this with the
stuff I already had from the STNET-software, edited only some
IP-adresses. Then I thried it and it didn't work. I couldn't find
anything that could help me in the "manual."
Well, actually I found some sort of command called bootpd or something
like that, but NOS doesn't know that command.

That explains my question:

Is there a STARTUP.NOS that can handle that or isn't it possible at
all?

Thanks in advance for all replies,

Greetings,

DOOM - no way. At the moment, we've got an ARM6 going pretty well flat-out and it runs at approx. 35fps (should be faster when triple-buffered but will slow down when the texture mapping code and music are inserted and the actor code gets switched back on). At least I think no way. Someone could always prove me wrong. But there's also a *large* licence fee.

Wolf3D - more feasible. Someone (*not* me) should be able to write a raycasting engine which runs on the DSP; this is the major consumer of time in W3D but since it runs in a orthogonal world (rather than the arbitary-angled walls used in DOOM) it's reasonably easy to do fast. Anyone wants any help - feel free to mail us (jon@powerslave or eddie@powerslave. Ed's the ARM guru but we can both explain the maths used) and anything which we can answer outwith the confines of the NDA (and since the rendering engine was written before we got the source code, that's quite a lot) we will. Licence fee - $10 000. Not owning a Falcon (and knowing very little about coding for the 56001) rather preclude me from doing it (plus the fact that we've got a DOOM port to get out of the door :-) Of course, if a development house wants to loan me a Falcon and will put up a licence fee (which we might be able to negotiate with iD - they're not that bothered about making more $$$ out of W3D) then I'd be happy to do it :-)

Alternatively, if anybody else wants to do it, mail iD and ask them - it's what we did.

Well this is certainly true, but most machines work like this. For example, almost all Mac's have a "Processor Direct" slot that's the same as the ST, and if you want to go WAAAAAY back, the S-100 bus standard was basically the CPU's pins and the power supply printed out on the backplane. In fact, most machines have this definition of "local". NuBUS is not local, nor is MicroChannel or PCI.

I have a 1040STe, 1 meg, and connect to an HP unix system; is there any program to perform software compression of the communications? I remember using a similar program for a local Atari BBS a long time ago. Even the source for that program would help. If anyone has such a program, or such source, or know where to get it, let me know? I would be willing to port the host end over to UNIX, no problem.

I've a Falcon for sell too! In the US (preferably in the DFW Texas area!)...
4megs, Falcon-Speed (12mhz '286.. just fine for Windows based "Internet in a Box." Just not as snappy as
on a 486 or better..), SC1224 monitor, 80meg internal IDE drive, etc...
Software includes such things as GFA Basic 3.5e, AtariWorks, Warp-9, Assempro, DevPac, SpeedoGDOS, MultiTos, the true-color paint prog, etc...
Only prob is it doesn't like external SCSI drives (been told that it was a common "loose spring" prob that an
authorized repair center can fix) at all.. For me, it's no prob. For others, well..<grin>
Only $600 or so plus 1040ST....

Paul Hills (hillsp@genrad.co.uk) wrote:
: What is the best program for doing screen grabs? Thanks.

This mainly depends what you are grabbing.

Are you looking for an accessory to grab the screen during a dtp session etc. or are you trying to grab picture from games etc?

If you are looking for low/med resolution game screens then can I suggest ProbeST. The PD version (which I and Jon Garry wrote) will grab most things. It does say that you can register (with me) but I have no ST and have not done for over a year so you can't! Merlin PD were stocking the full version, and they were supposed to give us royalties but I havn't heard from them for over 2 years so....

If you want an accessory version then nearly every PD company will have a few so just ring up a company.

Chaz.

Hello World ?
I've just gone and got myself a colour printer, Panasonic KX-P2135 (and I don't really care what you think of it!).
What I do want is a bit of help and information.
As it can do colours I want to be able to use it to the best of it's abilities with my STe. Can any one tell me if I can get Write On or Timeworks 2 to print in colour and what WP & DTP they would recommend for colour printing, the manual says the printer emulates and Epson LQ-860 & IBM Proprinter X24E.
If you know of any of the other WP's that have appeared on any of the UK ST Mags let us know too.
Thanks for any Help!

Ade.

Thanks Doug.

Do I assume that the write cache exists on a '030, just so that the CPU has
quick access to recently changed data?

SCSI 2 is just a Standard that Allows for FAST Hard Disk Transfers.
Normal SCSI 2 can go up to 5 MegByte/Second. SCSI 2 FAST can
go as high as 10 MB/Second.
I'm using a Seagate ST3600N on my Falcon, SCSI 2 FAST capable,
BUT, the Falcon is NOT that fast. With ICD's "RATEHD" all I can
get is 1.9 MByte/Second. It is the Falcon's HD controler I think. I have
the same type in my PC and it runs at 8.9 MBytes/Second under Test
conditions.
I have also used a Fujisti SCSI 2 FAST, I forget the model number,
and it ran the exact same speed on both the Falcon (1.90 and the
PC (8.9).
Number 3 and 4 I have no idea about.

Narwhal...

Don't you still have you Flash II master disk? If so, just reload that
onto your new hard drive and continue using Flash II. It's a heck of a
lot easier to use than the old Flash.

Richard John Kelsch (richcsst@crash.cts.com) wrote:
: Does anyone know of a version of POV that displays as it traces for the
: Falcon??

Just plain POV2.2. It has a pretty good display in 256col mode,
but slow. 16col mode gets faster display, but you get less of an idea how
it will turn out. Of course you *need* a fpu (unless you want to leave it
on all night even for a simple image). It works really well on my TT030.
Remember, however, that if you just want a fast trace, the drawing to
screen slows it down quite a bit (at 160x100 it adds about 1 minute to
therendering time on my TT030, and the actual rendering takes about 3mins
for a 6K POV file.)

>I've got a US Robotics 14000 "Sportster" modem, and use it together with
>"Connect" (which is a program I recommend for any Atari user with a modem!).
>I just downloaded a file and saw that the speed was about 800cps- is this
>normal or is it too slow?

I use a USR 14.4K Sportster with my unmodified 1040ST. I usually use
zmodem (rz/sz) for file transfer -- a version that buffers all data in
RAM until the transfer is finished, so no disk writing time is incurred
on downloads (except for extremely large files). I typically get
over 1600 cps for binary files and over 1800 for ASCII text. 800 is
definitely too low.

The problem may be in the configuration of your modem -- reading the manual
carefully is probably your best approach in sorting this out. But you
should also confirm the simple things that are sometimes easy to overlook.
Make sure the Atari serial port is set to its highest speed (19,200 for
the standard system software), and configured to use RTS/CTS handshaking
instead of Xon/Xoff. My understanding is that the RTS/CTS hardware is
assembled correctly but that the software handles it improperly, so
you should use an auto folder patch for this. I currently use HSModem
(Utilities/Tosfixes/hsmoda06.lzh on atari.archive.umich.edu), but have
had similar success with TurboCTS (Utilities/turbocts.lzh, for which
I see there is a patch, Telecomm/serfx20.lzh, that claims to fix a
TurboCTS problem) and with the standard Atari TOS 1.4 patches that can be
found in Utilities/Tosfixes/rainbow.arc.

You should also confirm if possible that the cable between your computer
and modem actually has the RTS/CTS wires (most cables these days have
all pins connected, so you should be safe).

When the modem finishes its negotiation and establishes the connection,
it prints a connection line that includes the connection speed. Confirm
that this is 14,400. You should also note whether compression/correction
has been negotiated (the manual explains what the various pieces of this
connection message mean). If the speed is lower, then either the remote
modem does not support higher speeds or the phone line is too noisy to
support them. Even if the connection is made at 14,400, the modems may
agree to reduce their speed if they detect too many errors on a noisy
line. A speed of 800 cps might make sense if the line speed has been
dropped to 9600 and a small number of errors are still being produced.
The USR allows you to print diagnostic screens that summarize the
characteristics of the connection and tell you things about the total
number of octets (bytes) sent and received. If you are still having
problems, you could look at one of these screens to see if any of the

numbers are far out of line, suggesting some other problem. Again, your manual will tell you how to get this information (on mine it involves first entering immediate mode with the +++ sequence).

I hope something here helps. Cheers, and good luck,
Scott

3013. Stalker v3.04 and NVDI 3.01

Newsgroup: comp.sys.atari.st
Date: 1995-05-18 00:00:00 UTC
From: Desmond_Liu@mindlink.bc.ca
Message-ID: <70849-800860776@mindlink.bc.ca>
Source record: 165336

> You MUST upgrade to 3.04 if you want the GDOS stuff to work with STalker.

Whoops. The subject title should have read "STalker v3.04 and NVDI 3.01"
(like I did in this subject title.) I've applied the patches to upgrade my
STalker to v3.04.

Anyway, I'm still having problems. When NVDI 3.01 is loaded and I initially
start up STalker 3.01, I see the hard disk light on my Falcon flicker away.
Presumably it is doing a vst_load_fonts() since I have a *lot* of Bitstream
fonts in my font directory.

After a while, the hard disk light stops and STalker seems to just lock up
with the "STALKER.PRG" title on the top center of the screen. I do not see
this problem when I use SpeedoGDOS 5.0 by itself without NVDI.

With SpeedoGDOS 5.0, there is a lot of initial disk activity, but at least
it doesn't lock up.

Any help is much appreciated.

3017. CKBD (was: Re: Who has the most sexy AUTO folder?)

Newsgroup: comp.sys.atari.st
Date: 1995-05-18 00:00:00 UTC
From: alpldbia@w352zrz.zrz.TU-Berlin.DE
Message-ID: <3pfo3u$dom@brachio.zrz.TU-Berlin.DE>
Source record: 165340

In article <fdd_9505161447@genesplicer.org>,
Terry May <Terry.May@rebel.genesplicer.org> wrote:

> AL> ckbd.prg -- best keyboard driver ever seen for TOS,
>
>Please explain what this does and where do you get it?

First of all it enables you to access _all_ ASCII characters directly
from the keyboard. This is achieved by providing several 'methods' of
entering special characters. Those methods are:

* Compose
* Deadkey
* Extkey
* ALT-nnn
* Keyboard remapping

Compose: hit the Alternate key as if it were a normal key and then
type the two characters to be composed, i.e. [Alt] [a] ["]
gives a-umlaut. The internal table of compose pairs can be
replaced with a customized one (compose tables can be edited
using the program SetKey).

Deadkey: Some keys on the keyboard won't be displayed when you hit
them. You have to type a second character which CKBD will
try to compose with the previous. This is useful if you
write a lot of text with accents (French) or umlauts (German,
Swedish).

Extkey: This feature is taken from Alex Esser's program ExtKey. There,
you frist type the main character and then the overlay charac-
ter with the Control key pressed.

ALT-nnn: This is known from DOS but you always have to remember the
ASCII code of the character you need.

Keyboard remapping:
Simply define a new keyboard layout.

CKBD also contains a sophisticated mouse accelerator (which can handle
a rotation of the mouse, swap the mouse buttons, speed the mouse in
dependence on the screen resolution, speed the mouse according to a
polynome function...).

Every feature can be turned off.

Perhaps where it really shines is in editing the actual operating system (read: System software).

3020. QUES: X-or for Atari ST and Kawai K5

Newsgroup: comp.sys.atari.st
Date: 1995-05-18 00:00:00 UTC
From: gbar@mcs.com
Message-ID: <gbar-1905950431560001@gbar.pr.mcs.net>
Source record: 165343

I just got v. 1.1 of X-or for the ST. I have a Kawai K5 synth at v. 1.2. The X-or profile says it is for ROM v. 1.0 (is that the Kawai version it wants?).

When I try to do a Get Bank, the singles get transfered, but the first multi fails, stopping the operation. This happens regardless of whether I ask for singles or multis from the performance window.

Any ideas/suggestions/places to get a better profile?

Thanks and have fun! - Bob

A checkered floor like the type seen in countless demos or even space harrier would have made better visuals without taking up much processor time. Light shade them to the darkness, and change colours for different sections would make location easier...

Rod,

Thanks for listing us in developers list. HOWEVER...

We have moved our web site and I would be grateful if you could update our
entry by modifying our web sites as follows:

change

www.tecnation.com/tecnation/

to

www.tecnation.com

and REMOVE the starbox site listing altogether.

Many thanks.

Finally, from one Brit to another...

I do hope it stops raining here in California, because it's making me homesick!

Alex

Just find a MOD file editor/composer, it will let you "run" both a
sequencer and* sample playback on the same machine! Hopefully there's one
for the STreplay 16, I've seen ones for the original STreplay, and
STreplay 4.

I don't know if all US Robotics ship configured the same over seas,
but the default setting works ok on my Falcon using STalker. I have
set the "N" to &N8 to ensure high speed connections but thats not
really necessary. Pages 4-4 to 4-16 in the manual should get you
going. You should see at least 1400-1600 cps going 14.4 with a zip
file. Are you sure the host is going 14.4?

:) Mike

DT> ... Calamus is available for Windows NT

Hi Darren-any ideas what the minimum DECENT speed PC is needed
to run SL NT? I have heard that a DEC Alpha workstation runs SL NT
like house on fire, but I was thinking of something that was 1/2 way
reasonably priced like a Pentium or DX4. And yes, I run SL on a 16
meg Atari Falcon. :-)

BTW-locally in Vancouver, British Columbia, Canada, we have
8-10 dedicated Calamus 1.09 and SL users-4 of whom make a living
doing DTP with Calamus. Glad to hear that your support board exists,
and I will be phoning to get the sample Cal User Mag file. Thanks.

> Hi All,

Okay - I'm a TT owner - but I do know about Falcons - and have spent a lot
of time recently playing with Linux/68.

> * 14 megs of RAM sounds nice. I see here that Toad Computers sells
> a "14MB board" for $599. Is this the board, and not the RAM? I've

At $599 it ought to be the lot. Its too much for just the board. I don't
know what memory costs in the US - but here 16Mb is about 350ukp - 400ukp
which translates to about $5XX. $100 odd for the board would be about
right.

> never upgraded before, so I don't know. What does the RAM cost?
> And what does SIMM have to do with it?

SIMM is 'Single In line Memory Module' its the basic description of the
memory you want - though there are at least a dozen variations. Its likely
you would need a 16Mb 72pin 70ns SIMM. best to check though.

> * Compared to other upgrade options, the $99 PowerUp 32MHz is cheap.
> This is only cache, though, and really is not guaranteed to double

AFAIK its actually a clock doubler like the TT has. 15% to 30% speed
increase.

> * Now for the hard drive. Options, options, options! Toad also sells
> a 1.1GB HD for $619 (external) 8ms. I figure I'll get something like

Its almost always best to buy disks from general PC dealers as they will
be cheaper. If your new to this game though - Toad may be a better bet.

> * What's the diff between IDE and SCSI? I see a gig IDE HD for $399.
> SCSI is better, I think.

SCSI is a general peripheral bus standard which allows connection of up
to 7 different devices (mostly storage devices of one type or another).
IDE is basically a 2 Hard drive system - though modern PCs can cope with
4 drives - one of which can be a CD-ROM.

SSCI should be faster - at least compared to the Falcon IDE interface.
Actually the Falcon IDE drive is *bad news* under Linux/68 and you could
well be advised to removed it.

:-)

Roland.

> how can I display a system modal dialoguebox that waits for multiple
> events?
Well, I guess you don't lock the screen via wind_update. Do the following:
```
wind_update(BEG_UPDATE); /* lock the window-rectangle-list */
wind_update(BEG_MCTRL); /* reserve the mouse for your app */
[display dialogue, etc.]
wind_update(END_MCTRL); /* free the mouse */
wind_update(END_UPDATE); /* unlock the rectangle-list */
```

This should work.

> 2. Also, how can I detect if either mouse button (or both) is pressed using
> evnt_multi() - If I use the value 3 for the mouse parameter it still
> doesn't work.
For that, use evnt_button(258, 0, 3, ...) or set the corresponding vars of the evnt_multi-call to this values. This will cause the AES to wait for button 1 or button 2 _not_ being released, i.e. pressed (or even double-klicked). This trick has been undocumented, but AFAIR it's now allowed, and all versions of the AES are able to cope with it (except the Geneva-AES, but this may be fixed now).

> 3. How do I implement cycling of windows (i.e. using the CTRL-W keyboard
> short cut)? How do I know which window is the one that should be
> topped?
Well, for topping the windows, just use wind_set(window, WF_TOP); Of course, you do that only for windows that belong to your application (or of those using the AV-protocol, if your app supports this). The simplest method of cycling is just top the next window in your internal window-list (I hope you keep one), using a pointer or something similar. If you want to do it more

sophisticated, you could detect whether the running AES supports WF_OWNER
and the extra-fields in WF_TOP. With that, you are able to walk thru the
window stack currently on screen and identify your own windows. Cycling
could then mean topping the "lowest" window of your app. Try to support
WF_BOTTOM as well (backdropping)...

> 4. This isn't a programming question, as I've finished the record/playback
> section (apart from the niggles above) - I was thinking of uploading it
> to an FTP site so that I could get feedback from potential users (this
> would look good in my final report). How do I go about this - I've never
> actually uploaded anything - however I do have full internet access.
> Secondly, which FTP sites would be the best to upload it to?
I suggest uploading it to atari.archive.umich.edu, micros.hensa.ac.uk,
ftp.cnam.fr, and to ftp.uni-kl.de, because these are the most important
servers around (at least for atari-soft). If I forgot any, please name them.

Ciao

Thomas

P.S.: Yes, I'd be interested to see your results...

> Up with punch cards!

I'm terribly sorry but I'm afraid you missed my point. I'm not saying
you should use punch cards because that produces better output in the
end, I'm saying you should _not_ use a WYSIWYG layout package when you
don't know anything about typography, which I'm sure will be the case
for the majority of users. The author of TeX has spent his time on
implementing typographically correct algorithms instead of focusing
on a flashy GUI (but this is < 1980 stuff). Frankly, I don't care
whether you find TeX hard to use. I don't care how easy it is with
your WYSIWYG WP to create an awful page in just a few seconds. I
don't care whether you can produce an ugly screaming yellow-on-pink,
shaded, rotated, skewed section head with a GIF texture-mapped onto
every `o' in it. I want readable, typographically correct documents.
And I'm willing to spend some time learning how.

> Would you use TeX to make a 3 page picture pamphlet? Probably not, it's
>not what it's for. However, you can do this AND formulas in FrameMaker.
>And a lot of other things too.

Ummm... What are you saying here? `Would you use program XXX for
something it's not meant for? No? Well, I have program YYY here that
does a better job at it. So it's better than XXX.'

I don't *want* to make 3 page picture pamphlets (nice tongue breaker,
that!), if I would I would have bought Calamus or something like it.
I want to make scientific documents. That's what I use TeX for.

> TeX, IMHO, is how computers USED to be. You entered arcane commands
>into text files then submitted them to batch programs for processing.
>Those days are over.

These are the days of `I know everything about everything. I *know*
how one should layout documents. Those archaic craftsmen are just
pathetic, with those hundreds of years of passed on experience about
the fine points of their art. I have a program here, built by as many
as ten programmers in two years time --- It must be just as good.'
God, everyday thousands of *ugly* documents are produced --- and their
authors don't even *realize* it.

These are the days of just having to press Shift-Alt-Cntrl-F6 to get
boldface text, instead of entering the arcane command sequence \bf.
These are the days of incompatilbe file formats, needing UUENCODING to
send them via e-mail. These are the days in which not having a PC
with wordprocessor XXX automatically means you can never read the
documents written with it on your own computer. These are the days of
having wordprocessor XXX 18.132 means you can't ever use your
documents of XXX 18.131 again. These are the days of having to
upgrade your computer just to be _able_ to run the next minor upgrade
of your wordprocessor.

I'm getting carried away... I'd better stop now.

Regards,

There is a complete program with schematics at src.doc.ic.ac.uk (mirror
of atari.archive.umich.edu). It requiers soldering with chips because
the ST parallel port is a bid braindead.

Good Luck

Hiya

Does anybody have a copy of ST Replay 16 for me to buy. I'm in the Sussex area of the U.K... if that makes any difference

Also does anybody know if it is possilbe to have 1 ST as a sequencer (Which Sequencer I don't know?) and a second connected up as a Sampler (ST Replay 16). I'm a greedy git and have access to several ST's and if it is possilbe to do this could save me some money.

Thanks if you can help

|> CS-TeX allows you to put GEM-images or GEM-metafiles into you documents.

OK, but what does CS-TeX create as output? Does it create
a standard DVI file that can be printed out on any other
platform that has TeX installed?

|> Did you ever try to use a Papyrus-document including pixel graphics
|> with other software (e.g. Works or Tempus Word)??

No, I didn't try that. But at least I know that everything I create
with papyrus at home will give me the same result with the same
software on a different platform: OS/2. papyrus also supports RTF
to import/export documents from other platforms.
I wonder if you could create a document with LindnerTeX, including
IMG files and 100% the same result under UNIX on a SUN workstation.

|> >The current implementations of LaTeX on the ATARI computer line are cheap

|> If you do not need the latest implementation - e.g. LaTeX 2.09:
|>
|> CS-TeX is free!! It is AFAIK available via FTP at paderborn.de or
|> tu-berlin.de. And it is possible to use LaTeX 2e with CS-TeX.

Agreed, but can you expect that CS-TeX is supported any further?

|> >Which "sophisticated things"? My opinion is that this is absolutely not true.
|> >Talking about special features: LaTeX doesn't offer you scalable vector fonts.
|> >papyrus and comparable WPs _can_ do this via NVDI3/Speedo5.
|>
|> Did you really work with LaTeX? I dont think so... because you can
|> scale TeX-Fonts at ANY size you want!

But not _directly_! Every font that you need in a certain point size
has to be created with METAFONT first and saved as a compressed bitmap.
If you do this for _every_ point size that you might ever need, your
machine will be blocked for hours with this task. And afterwards, you
might have very few disk space left on your TeX partition.

Now don't tell me that this is an easy and flexible way to handle fonts.

|> >|> Oh, I forgot one last point: If there is something that LaTeX is not able to do,

|> >with TeX and to write macros in TeX. Hardly anyone. LaTeX itself already
|> >is complex enough.
|>
|> It is very easy to create environments, new commands etc.

That depends on what you want LaTeX to do.

|> Again: Did you really work with LaTeX? Did you ever read a good
|> book about?

I have worked with LaTeX for about 18 months and read standard
literature by H. Kopka about it.

I do not have any doubts that LaTeX is a very powerful system,
especially to create long documents with mathematical equations,
lots of references etc. However, I don't think that it is really
easy to use, especially for beginners, and that one doesn't have
to care at all about how the output is going to be.

For example, LaTeX doesn't free you from the task to set pagebreaks
right. It also doesn't tell you for a given tabbing environment
whether a word, placed at a certain tab position, will exceed to
the next tab position or still fit in its column. The problem is
similar when you want to place text in a given table environment
with relatively narrow columns (linebreaks ...).

LaTeX doesn't do everything automatically. Neither does any other
typesetting or wordprocessing software do this. But as soon as
problems like the above arise, a wordprocessor like papyrus is
quicker and easier to use.
papyrus doesn't have the power of LaTeX when it comes to certain
features like references and citations - although common environments
like {itemize} or {quote} are easily created and used - every
paragraph format that you create can be named and repeatedly
recalled with its name.
LaTeX is clearly weaker than papyrus when it comes to _other_
features that are more DTP-like, e.g. creating a "newspaper
style" page layout with text going from one box (not only
columns) to another and around graphics.

I don't claim that papyrus is the best software to create
documents, nor do I want to say that LaTeX is the worst
system to do this. Every system has its specific advantages.
However, LaTeX's advantages only become relevant with large
documents that contain equations, use a lot of references
etc.

Source record: 165390

Hello all
I just need some info on the Falcon for a friend, planning to get one.
What is the reccommended amount of RAM to start off with, 1,4 or 14meg?
And hard drives? Possible to take bog standard 3.5" HD IDE and plonk
it internally? Prices?

Also, is it possible to use SIMMS instead of Atari's standard?
If so, how, prices, places to get stuff from and any info you think I've
missed, please inform me.

Email please if possible, I don't log on that often any more, and I'm
bound to miss any messages on news...

Thanks
BuzMack

I took a look at TEX a long time ago and decided that since
my stuff was not being published in book form, I had no real need
for it. As far as ease of use goes, it is right up there with WordStar.
Most of us have at least heard the horror stories about learning to
use WordStar. That program was one of the main reasons that IBM users
were afraid to learn more than one or two main applications. Who has
2-3 months to devoted to learning a new program? TEX falls along the
same learning curve! Shades of the Commadore 64 word processor! Of
course, there are things that demand that type of power. Luckily I
don't get into that complicated a document!
I do find it annoying that a shareware author would put the
docs for his program in TEX format. I wont name any names, but I am
of the opinion that straight ascii would have done the job more than
adequately! Hint! It was a telecomms program!

I am looking for some spreadsheet files (either older *.WK1 or *.LDW)
for federal tax forms 1040, the Schedules A, B, and, D and form 2555.

They probably have not changed any over the last couple of years,
right?

Are these available from any FTP site?

Thanks to all,

Eh? The Falcon's ring detect line works flawlessly here. Maybe your cable is
at fault?

I'm really glad to see that there are some reasonable people out there who care about quality. Nevertheless, I think that people should be free to continue to create awful-looking documents - as long as I am not forced to read them...

We've been selling Atari emulators for MS-DOS and Windows for 3 years.
Look on our web page on http:://www.halcyon.com/brasoft/ for complete
information or email me your postal address and I'll mail you our product
brochure.

Branch Always Software is now on the World Wide Web. You can access our home page at "http://www.halcyon.com/brasoft/". You can connect now and immediately download the latest freeware version of PC Xformer, the Atari 800XL emulator for MS-DOS, Windows, and OS/2 Warp.

Within a few days we will also have the PC Xformer 3.0a and Gemulator 4.0 product announcements posted, along with screen dumps of the new Gemulator 4.0 Mega STE emulator for Windows and OS/2 Warp, and a complete list of Atari dealers who sell Gemulator and PC Xformer.

If you only have news access but not web access, you can still email us and we'll mail you our free product brochure which contains all of that information. Just send us your postal mailing address if you would like it mailed to you, or your fax number if you want the information faxed to you directly. Our email addresses are:

3071. IBM 8515 on my F030?

Newsgroup: comp.sys.atari.st
Date: 1995-05-19 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <3pj9fo$dbo@gti.gti.net>
Source record: 165204

I've got an IBM 8515 monitor hooked up to my Falcon, and it's working to a point, execpt that I can't get ScreenBlaster to work with it (or very well). Anyone have any ideas on how to get it so I can get at least 800*600? The list of monitors doesn't list an IBM. Poking around at the risk of blowing the monitor, I discovered that it needs at least 31Hz horiz. sync and an unknown vert. sync. I don't know if this monitor is multisync or not (I sure hope so!!), but since it didn't cost me anything, I've nothing to loose...

btw: I have the original ScreenBlaster; I understand that there has been at least one update to the software, but just never got around to it.

In your case this isn't enough. Also use wind_update(BEG_MCTRL) /
wind_update(END_MCTRL) in this case. The BEG_UPDATE semaphor will
prevent anything from moving on the screen while set, whereas
BEG_MCTRL will send mouse events exclusively to the application
which has set it via evnt_multi so that windows don't react.

I had the same problem, and got it to work by disabling a bunch of my (bitmapped) fonts. I got the idea from someone on GEnie who had the same problem and the same solution. It would seem that STalker can't handle very many fonts.

>1. Is SCSI-II the same as FAST SCSI-II ?

Yes and no. SCSI-II is a set of commands and ONLY a set of commands.
FAST SCSI-II is a drive like the "normal" SCSI-II drive, but got some technical
commands for internal use. There's also WIDE SCSI-II and the latest SCSI-III.

A "normal" SCSI-II drive and a FAST drive are both compatible with each
other, (though some internal stuff wouldn't work ofcouse). Some people claim
a FAST model is faster, but i doubt that. Specially on the Atari you wouldn't
know the difference as Tos can max go up to around 1.8Mb/s

>2. Is anyone out there using an IBM SCSI-II drive(s) with their Falcon
> (= do they work with a Falcon, are they good?)

Sorry no!

>3. Are Seagate Hawk drives really "second class" as some dealers say?

It's probably "second class" if you compare it to the SpitFire model, but
i guess the Hawk is good enough for most issues.

I think i recall what program you're talking about. And if thats the one
it doesn't work with Tos 1.6 and above. (Don't know if it'll work with
Tos 1.4). And it gave wrong results as well.

I *think* it's ttyS1 or ttyS2.

You need to set the partition type to something other than GEM or BGM.
Or you can use a swap file.

> I would rather get the drive to work with TOS, since partition 1 is
> my MiNT partition.

You can use MinixFS partitions under linux if you mount them manually &
not from the /etc/fstab file.

>3. Is there any way to format a drive without using the ICD formatter?
> I don't see any way with AHDI to format a drive, unless I am missing

I suppose you must be missing a program called HDX.PRG. That's used to
format, partition & zero hard drives.

Tom, I agree that TeX and LaTeX are not easy to learn (I've been using
LaTeX for a few years & I'm still learning), but I think you're wrong to
comare a *Wordprocesser* with a *typesetter*.

: narwhal@netcom.com

Try STarCall... vt52,100,200,220,ANSI & TTY,, X,Y, & Z modem. Built-in text editor & separate buffer window...etc, etc... You will NEED a D/S disc drive (720K min) as the files to run the package total around 600K

Version 2.0E has now been released in ENGLISH... the demo is fully featured with only a shareware delay reminder to TRY and get you to pay the VERY low S/W fee of 35 DM (whats that in US$'s 20 ??)...
Can't remember what FPT site I got it from, however you can get it direct from STarCall's BBS on (GERMANY) 02363 2610

Try it you'll LOVE it......

3099. MiNTnet - Which file should I get?

Newsgroup: comp.sys.atari.st
Date: 1995-05-19 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <3pgqsi$8se@status.gen.nz>
Source record: 165261

Hello,

I have manaed to figure out what files I need to get MiNTnet up and running.

I have a couple of questions:

1. I believe it will work with MiNT 1.12 without need to recompile. Is this correct?

2. The latest version is 0.5pl6. Is this true, if not, what version is latest?

3. I have found that MiNTnet is at the atari.archive.umich.edu in /Mint/Network/. Well, there are so many files, and I am not sure which ones to download. I have discovered that I will be needing Telnet, Udpprobe, Ping, Ncftp. I have found those files without a problem. However, I cannot figure out which files contain the actual MiNTnet itself.

4. Do I need any other files not mentioned above? (Apart from Sh.)

5. Is there anything I should know not contained in the MiNTnet FAQ?

Your help is greatly appreciated.

-Mario Becroft (mbecroft@iconz.co.nz)

I think the program "SoundLab" is what you are looking for. I
have the Replay VIII cart, and have not used the replay software much
since I downloaded soundlab from GEine. It will play and save .WAV files.
It is also a faster program for things like echo, converting a sound from
one speed to another(in eather directions) you can sample and play back
at almost any speed from 6Khz to 30Khz in about 100 hz steps. It has
shaped fades and a bunch of stuff I'm sure to remmember as soon as I send
this off.
look for sound lab at on a cover disk(I don't get any magazines so I'm
not sure which one) Or you should be able to find it at any atari FTP site.

Well I used to an ambitious ST game programmer but having to program Windoze and VAX systems at my job have melted my mind. I would like someone to get the benefit of a very good programing aid for GFA programmer on the ST. For the mere price of postage ($5.00) I will send you M.A.G.E (Magic Arcade Graphics Engine) $100.00 plus retail value for absolutly free, no strings attached (except for covering the five bucks shipping). So thats the deal, sounds too good to be true?? No this is for real, I simply want someone to get some use from this.

The details: E-Mail me at (dougmoen@texas.net) and tell me that you want it, I will reply to you for confirmation and then send the shipping cost ($5.00) at which point I will mail you M.A.G.E. Simple and basically except for the shipping.

Source record: 165265

> Does anywhere in the Internet a usable ST emulator for MS-DOS PCs exist?

I know of two such ST emulators, but neither of them is either Shareware
or Public Domain.

The Janus board is a product out of Germany (I believe), which emulates the
ST in hardware.. that is, it has a 68000 CPU chip on it and is essentially
an "ST on a board" that you plug into a PC. It's very fast, but I know
virtually nothing more about it.

The other product is the GEMulator ST Emulator from Branch Always Software
in Washington state in the U.S. It consists of a pc card you insert in your
PC which holds the TOS ROMs from an actual ST. The emulation is done in
software on the PC. It's not as fast as the Janus board, but with a fast
'486 PC, it runs faster than a normal ST.

I just bought a GEMulator, but haven't had time to install it yet. People
I know who have one though say they work pretty well.

BRAsoft has announced a new version of the software which adds a lot of
features and improvements. The one main thing still lacking from a full
emulation of the ST is that there is no MIDI support as yet.

The GEMulator board currently costs US$99, and they also sell TOS 2.06 ROMs
for US$69 if you don't have a set already.

(The GEMulator I bought came with two sets of TOS, both 2.06 for the latest
and greatest, and 1.0 for early compatibility.. you can choose to run either
one through software commands.)

> 1. I can't seem to set it for vt100 emulation (as I could with Flash II) 2.
> It only has xmodem and a very primitive ymodem batch (Flash II had zmodem)

The last version of Flash was 1.6... there are patch programs available to bring earlier versions up to that level, check on atari ftp archives.

The VT emulation in 1.6 is pretty crude, although it works for most applications (VAXphone can be somewhat messy though..!).

Version 1.6 also implemented CompuServe QuickB protocol, and you can download a Shareware external protocol program called XYZ.TTP which does X, Y and Zmodem. I had Flash set up with a macro key to call XYZ.TTP to do downloads.

Again, check atari ftp archive sites for XYZ.TTP

> source for that program would help. If anyone has such a program, or such
> source, or know where to get it, let me know? I would be willing to port
> the host end over to UNIX, no problem.

Actually, you'd be much better off with hardware compression, which
requires modems that can match protocols. Modem costs are down, but
compression costs extra [insert monetary unit here].

You can, however, easily obtain the GNU gzip utility for both platforms;
check atari.archive.umich.edu or the mirror at archive.wustl.edu for the
ST version (binary included). If the HP unix is HP-UX 9.x (possibly 8.x),
check the U.S. mirror of the Liverpool HP-UX archive at ftp.cae.wisc.edu
for tested, debugged, and ready to compile source code.

Text files are typically 25% of their original size when compressed with
gzip; great for downloading PostScript for use with GhostScript on the
ST, for instance. The ST gzip works well with a command shell (e.g. Gulam),
since you can decompress quite a few files at once (disk space permitting).

Just to warn you all - don't buy this game from ST Format. My friend Anthony Jacques ordered a copy from them at the end of FEBRUARY, and to this date (19th MAY) it has not arrived. All things considered, the UK distributor, Daze Marketing, has screwed up by not duplicating the disks, *but* a couple of weeks after sending his order, Future cashed my friend's cheque, when clearly there was no stock.

I am going to get my copy direct from the coders Aggression in Finland. They're a courteous bunch and won't mess you around. If anyone wants a copy of STARDUST, get in touch with Aggression at:

creator@xgw.fi

Their version is boxed and has manuals.

Ok, I didn't miss the point.

I disagree vehemently. There seem to be two faces too this issue, those that pick up an example of bad design and say "You see? This is why desktop publishing is bad!". I'm I incorrect in placing you in the group.

And there's the group I'm in. The ones that note that DTP that's GUI based and easy to use has revolutionized an otherwise dead industry. When the Mac Plus first got PageMaker, printing was owned by companies with large presses and charged lots of money. Now there are print shops on every corner.

Yes there IS more bad work out there, but there's simply 10 times more of _everything_ out there. The GUI created a printing revolution!

> The author of TeX has spent his time on
> implementing typographically correct algorithms

Which, when it comes to the market, no one could give a hoot about.

The system that makes a nice looking output is the correct system. Period.

> instead of focusing on a flashy GUI (but this is < 1980 stuff).

GUI has NOTHING to do with it. It's usability. The fact that the Mac was the first machine that put it all in one place (and later the Atari, PC's etc.) is why people relate the two.

> Frankly, I don't care whether you find TeX hard to use. I don't
> care how easy it is with your WYSIWYG WP to create an awful page
> in just a few seconds.

I can create a superb page in seconds too. I can create a better looking document in a minute that you can in TeX period.

There's the same comment again. People who don't use TeX can't design. The two are completely unrelated I'm sorry to say.

> don't care whether you can produce an ugly screaming yellow-on-pink,
> shaded, rotated, skewed section head with a GIF texture-mapped onto

> every `o' in it. I want readable, typographically correct documents.

And again. You can make "readable, typographically correct documents"
in any of the commercial packages, and spend less time both learning and
constructing.

> > Oh that's BS and you know it. Making a table in my WP takes seconds.
>
> I didn't write that, check your sources before you flame someone.

I wasn't flaming you, I was flaming the other guy.

>
> Ummm... What are you saying here? `Would you use program XXX for
> something it's not meant for? No? Well, I have program YYY here that
> does a better job at it. So it's better than XXX.'

No, what I am saying here is that TeX does a few things well. Other
packages do all of that, and a lot more.

I wrote one of my projects (on plasma confinement) in TeX. After
leaving school I rewrote it in MacWrite with a formula editor. I can't
describe how much easier and faster it was, and the results looked BETTER
because I could EASILY tweak what I didn't like.

> These are the days of `I know everything about everything. I *know*

> authors don't even *realize* it.

Sorry, that's an old and tired argument. I'm sure the buggy
manufactures had similar complaints about cars when they started appearing
too.

> These are the days of just having to press Shift-Alt-Cntrl-F6

No, those are PC's. These are the days of selecting text and selecting
Bold and it just IS. And you don't have to print it to see what it's
like. These are the days of placing text around pictures in seconds.
These are the days of doing colour matching and font selection on the
fly. These are the days of having your spell checking happen while you
type.

These are the days when you don't have to be a programmer or rich to
make a nice print.

General! We have intercepted a coded Imperial message from the Hodgkins system!
>> If something is messing with the cache, then there is a _slim_ chance
>> this write-allocate flag could be changed, but the effects would be
>> immediately obvious - CRAAAAASH!
PH>
PH> Do I assume that the write cache exists on a '030, just so that the
PH> CPU has quick access to recently changed data?

You assume correctly. The write-allocate flag tells the CPU to place any writes into the cache as well, which means the CPU will look there when the data is referenced in the future. Unfortunately, if the write-allocate flag is DISABLED, then the CPU looks in the cache for the data and gets an old value, which produces dangerous errors.

This sounds pointless, but has it's uses - the write-allocation takes an extra cycle, so when you are performing graphics tasks like block-fills, transfers polygons & texture-mapping, you can disable the write-allocator to gain speed since you don't change any variables or local memory that need to be re-read during that operation. You obviously need to enable the allocator and clear the cache when you are finished! You also have to watch out for interrupts (but there are ways to deal with this too).

If you really want to be clever you can deliberately 'lock' data into the cache (like bits of tables and so on) by using the 'freeze' bits which means you can stop other reads & writes from kicking useful data out of the cache you would rather keep.

In addition to this, if the datacache is not in use (i.e. you are performing a block-fill or block-copy operation) then you have nothing to gain by leaving it on. Disabling it will save a cycle or two on every instruction executed.

The instruction cache is almost always effective, so leave it on at all times.

Cheers,

Doug.

Hej!

I tried to install Linux 0.9.5 on my Falcon yesterday and I found some problems which really bother me. (The root.tar and the usr.tar were taken from the Whiteline Alpha CD.)

I created a minix and an ext2 partition on my internal IDE harddisk. A fsck directly after it showed no errors. But when trying to mount the ext2 partition I'll get a number of errors and the kernel refuses to mount it.
Is this an error of the IDE drive as somebody told me or have I done something wrong?

I also have problems to copy or move file. Also mounting devices works only via mount -a, otherwise do I get "unknown error".

And at least whenever I start a job in bash in the background and this job is ended I'll get logged out from the shell. Why?

Thanx!

chris

J'> I've got a hard disk host adaptor for (it says on the PCB) an
J'> ST506 drive. What's it all about?!

It will change the old-fashioned ST506 standard i/f into SCSI.

J'> I have a 40 MB embedded SCSI
J'> drive from a mac (which won't work coz the connectors are all
J'> different).
J'> What do I do?

Make or buy cable to connect to host adaptor.

J'> (I know, buy an ICD host adaptor.....)

That's right. And fit the 40Mb SCSI. I suppose you could also buy a ST506
to go with the ST506->SCSI adapter which would then give you a second drive
on the chain but it's prob. best to scrap the 506 adapter - who wants to
mess with them nowadays?

J'> (What is an ST506 anyway? some sort of non-embedded SCSI drive I
J'> presume?)

It's not even SCSI which is why you need the adapter to go with it for an
Atari. I think it was the first "standard" i/f for HDs (or Winchesters as
they were known then!).

In a message of 07 May 95 John Perez (2:320/220) wrote to All :
Greetings from sunny Corbarieu, John!

I've been running my small firm using two excellent softs (under GEM), Gestion Commercial (Sales management) and Gestion Comptable (Accounting). The latter is, I'm afraid, too application-specific, in that accounting systems vary greatly from one country to the other. The first one however (Sales Management) is perhaps what you're looking for, as it does exactly what you're looking for, and more. It *is* a French soft, unfortunately, and at the moment exist only in French.

However, I was recently discussing its marketing with the developers over here in France (my firm handles software translations), and we all feel there would be a market for it abroad, as its open-ended design makes it easily adaptable to different business practices (I'm American myself).

It is very stable (I've run it on the Mega Ste, and now, the Falcon), and has been getting _excellent_ support for the past 5 years, with regular updates every 4 to 8 weeks. The author (I ring him every couple of weeks with ideas or criticism) says it will run on any Atari machine with a minimum of 500 Mo of RAM, and a floppy disk drive.

I don't know if I sparked your interest or not; I could probalby arragne to get a demo (in French) sent out to you, if you can handle a minimum of that language.

I've taken the trouble to write this because it's a product I enjoy using and believe in (it's a pity the French are not more aggressive with their marketing overseas).

3128. STe & 8 bit Hardware For Sale

Newsgroup: comp.sys.atari.st
Date: 1995-05-19 00:00:00 UTC
From: troyc@bnr.ca
Message-ID: <3pin5k$ddr@batph8.bnr.ca>
Source record: 165290
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,misc.forsale.computers.other.misc,misc.forsale.computers.other.systems

I have the following item for sale. I have not used them for quite some
time, so they are just sitting around collecting dust:

Individual Price
1. Atari MegaSTE System ($400)
- 16 mHz 68000 CPU
- 4 Megs RAM
- TOS 2.06
- 1.44 Meg Floppy
- External Keyboard
SC1224 Color Monitor ($85)
80 Meg Hard Drive System ($100)
- ICD ADSCSI+
- OMTI RLL Controller
- OMTI MFM Controller
- 40 Meg RLL Drive
- 40/23 Meg RLL/MFM Drive
- All above in standard PC case
- HD system has complete Mint+Mintnet configuration

Whole System for $500!

2. Spectre GCR 3.0
All original software included
All Mac disks I have
PRICE: $200, shipping included
(I know this is high, but that is because I don't REALLY want to sell
this, but I will sell at this price! With a new version of "the
product which was previously known as Spectre" on its way finally
(see Dave Small's recent posts), this may be something to hold on to.)

3. PC Ditto II
All original software & hardware & manuals
I got this to work once, but then I switched to a Mega STE so I
cannot use this board. I cannot guarentee it works.
PRICE: $50, you pay shipping

4. Atari 800XL 8 bit system
- Atari 800XL 64K computer
- 1050 "Happified" floppy drive, which needs works.
Drive light comes on, but motor does not spin. Should be easy to
get fixed.
- Okimate 10 Color printer
- Amdek composite monitor (I even hooked this to my AV receiver and
watched TV with it)

- Tons 'o software: games, word processors, games, graphics, games
(did I mention games?)

Whole system for $100! No splits on this one.

: > actually uploaded anything - however I do have full internet access.
: > Secondly, which FTP sites would be the best to upload it to?

: I'd say the best sites ar umich (hard to get to but mirrored at sunsite) and
: Hensa. Give Danny here a shout and I'm sure he'll help you out.

Thanx for the cue, Simon. BTW, you can't upload to a mirror.

Anyway, to upload to hensa, ftp into micros.hensa.ac.uk, and make sure
you set the binary file transfer switch, by typing bin after logging
in.

cd into incoming, and then into the relevant sub-dir:
atari-tos
atari-mint
atari-falcon

and upload the file in there.

Once you have uploaded the file, you will not be able to see it as the
file permissions change straight away.

Please also upload or mail me a text file describing what you have
uploaded.

My Falcon handles 115200 baud with no modification quite happily. The highest CPS I have achieved so far with my 28k8 modem was a mere 7352cps though. :)

3139. Re: About LaTeX (was: Re: My newish PM6100...)

Newsgroup: comp.sys.atari.st
Date: 1995-05-19 00:00:00 UTC
From: kentv@ifi.uio.no
Message-ID: <3phit6$ej8@oin.ifi.uio.no>
Source record: 165301

There seems to be a debate going on about wether or not LaTeX
is the right environment to choose for document production.
I can only rely my own experiences, but as a regular computer user
for over ten years, I have some experience in producing documents.
I own both Calligrapher and Papyrus, I am a frequent user of Word
(for small projects, that is) and I have experience in Framemaker,
Calamus and PageMager.

If I wanted to make a glory little pampleth with pictures and
colors on it, I wouldn't even thing about using LaTeX. And that
is of course because that's not what the program is ment for. And
I do not use LaTeX for small letters, memos etc., because it is faster
to launch the common wordprocessor, type the text and thats about it.
Or is it? I mean, how many of you haven't got experience in
sending the "same" document five times to the printer, correcting
small details each time?

Anyway, for longer documents I have used FrameMaker and LaTeX.
I have typed two master thesis (complete, with layout, index, table of
contents etc.) for students using FrameMaker, and that was *not* very
inspiring. It did go, though. Now I am writing my own thesis,
about 200 pages long, and I am extremely happy that I discovered
LaTeX in time. For a student -- and especially a computer science
student, who is used to programming languages -- LaTeX is brilliant.
It is the FASTEST system I have ever worked with, it produces fantastic
results, and I CAN CONCENTRATE ON THE WRITING, rather than every little
detail about pagelayout, textflow, concistency etc. I have used it for
producing technical manuals, translated from english to norwegian, and
the results are much better than the originals that I believe were
produces using Microsoft Word. And, the beauty of adding a simple
\tableofcontents to get a proper and decent looking index, as well as
the extremely powerful bibliographical facilities, is well worth the
"extra effort" in learning LaTeX.

BTW. I thought my girlfriend, who is a biologist with very little
computer experience, LaTeX in 3 days. The alternative for her would
be thick books (I have never seen a fast reading for Word or Framemaker)
and late evenings trying to make her indexes look nice, fixing up
citations etc. Now she carries on using a small reference article,
with no pain at all. And much faster than she would have done it with
any other tool, IMHO.

I believe all those complaining about LaTeX has one thing in common:
They have never bothered to learn it properly.

And that is in fact a faster process than learning Word or Papyrus or Framemaker. At my university the students uses either FrameMaker or LaTeX for their writings, and LaTeX is far preferred, especially among those who have BOTHERED to try out both.

|> Can anyone point to revised maths libraries for Sozobon C with double fp maths?

You have to first find a *compiler* that supports 8 byte doubles, and
Sozobon is not one of them, it has sizeof(double) == sizeof(float).
Without compiler support you won't be able to use such a library. GCC
together with the MiNTlib does support 8 byte doubles (i.e., IEEE
double float).

Towers II is "Tryware". Access to the the first 3 levels is possible. To go
further than that you will need a password which is taken from the manual.
If you wish to continue by purchasing the manual you effectively have purchased
the full game and in that respect it is then a commercial product.

In my opinion it is well worth the money, and the game really starts to
improve after the demo section.

Unfortunately, financial constraints dictate that my Atari System must go.
The complete system bar the hard drive is on offer, comprising:

Hardware:

Atari 520STe, d/s drive, 4 meg RAM TOS 1.62
Naksha mouse with mouse/joysick extensions
a couple of nondescript joysticks (can't remember the make)
Alfa data Trackball
Alfa data clock module
Tatung 14" mono monitor
System Solutions Translator (DMA-SCSI) cable
Star LC2420 mono 24pin dmp multifont printer
Hewlett Packard paintjet 3630A colour inkjet printer (no manual or box)
All lead, cables etc
also external d/s drive (non-functional), thrown in as a bonus for a
fiddler!
spare motherboard, no ram, non working serial port
Major items boxed with manuals

Serious software:
Neodesk 4
NeoCli 2.1
Geneva
Timeworks 2
Fontkit Plus 4
Data Manager Professional
GFA basic 2
Personal Finance Manager 2
Atari Introduction to data management (superbase personal)

Games:

Elite
Millenium 2.2
Populous
SimCity
Tower of Babel
Steve Davis Snooker
The President is Missing
Star Trek - The Rebel Universe

plus:
another couple of hundred disks, many having free/shareware
six stackable Banx boxes

Magazines:
Atari STUser mags, various, later ones with disks
STFormat mags, full set to June 95, with disks
STReview, some mags, with disks
ST World issue 1 + 2

Open to offers on any item, but I'm looking at around ukp100 for the ST,
mouse and clock, ukp10 for the trackball, ukp100 and for each printer,
ukp50 for the monitor and ukp30 the translator.
serious software between 5 and 25 depending on item, games at a fiver each.
all plus shipping via system of your choice.
Mags I'll haggle over, but about a tenner a year with disks seems fair.

On the other hand 500 quid can have the lot, complete, and I'll throw in a
six way mains socket rail to plug it into.

e-mail with offers, (if any) please, and we'll discuss matters.

I don't like selling it, the ST has been a damned good workhorse for a lot
of years for me; unfortunately I need the money to buy a decent printer for
the new Mac.
That's progress.

It depends what you are used to.

I played it pretty solidly for a few weeks - and only got a medium sized
ship. Okay so I'm not much of a games player - and I didn't use any
'cheats' - but its not quite a 5 minute job.

:-)

Its has a slightly nicer case than a SM124 - but otherwise is much the
same.

SM124/5 monitors currently have a UK resale price of about 50-60ukp in good
condition.

You can use MiNT-Net without X - but you must be running MiNT. I use
MiNT-Net quite successfully with MTOS, or just MiNT on its own. It should
work with MiNT and the ROM AES also.

> need MiNTOS to run X (or do I!). MiNTOS scares me right now, though

Don't bother with MGR. Its a lot smaller and neater than X11R5, but nobody
cares about it anymore. I deinstalled my copy years ago.

X won't let you run GEM programs. There is apparently an GEM emulator for
X, but whether this is has been ported to MiNT-X I don't know. Anyway it
is also certainly going to be easier to reboot and run GEM native - unless
you have a really powerful Atari (accerated Falcon or TT).

You don't need MiNTOS to run X (or almost anything else). MiNTOS integrates
the MiNT enviroment very nicely - but as a whole you don't need it. The
odd part of it (like syslogd) come in handy from time to time though. I
supose it depends on how much Unix you know ;-)

:-)

>: dunno. what does ResEdit do ?
>
>It changes the file type in the header of a file.

It does much more than that. It is a resource editor like WERCS or
Interface, but since the concept of resource files is different on the Mac
and GEM platform there is no similar utility under GEM.

>
>Any ideas/suggestions/places to get a better profile?

Well, I have the same setup, same software version and it works fine
for me. However, let me offer a few suggestions, since the SYSEX
implementation of the K5 is a bit finicky:

1- Do you have any MIDI merging device between the computer and the
K5? If so, connect the K5 directly to the computer and try.

2- Do you have two-way communication between the synth and the
computer? This is important because of the handshaking that the K5
requires.

3- Is the K5 daisy-chained to other equipment using a MIDI THRU? If
so, proceed as in (1).

Sorry if this sounds too obvious. Good luck.

Gustavo

3161. PC-Ditto help!!

Hello!
I just purchased a second-hand copy of PC Ditto, and much to my chagrin, I found that I need to have a DOS system disk to start it up. Now, I have DOS formatted disks but not the system files (IBMBIO.COM, IBMDOS.COM and COMMAND.COM or equivalent), nor easy access to an IBM machine. I wonder if some charitable soul could e-mail me an uuencoded copy of those files. Thanks in advance!

> sector of the electronics industry don't ever write anything about it.

Some things never change. Back when Atari Explorer (Atari Corp's "inhouse"
magazine) was still being published, the people running the magazine could
NOT get a Portfolio to review from Atari, so they reprinted a review article
from a PC oriented magazine.

The article contained some mild criticisms of the product, and Leonard Tramiel
blew a gasket. He said Atari Explorer (remember, this was *ATARI'S OWN*
magazine) would NEVER, EVER get any Portfolio products to review from him.

The editors ran an editorial in the next issue giving their sides of what
happened, and Atari promptly fired them.

And people wonder why Atari has such problems succeeding in the world.

> Ironically, it may be the Tramiel's exit from the stage that may save Atari
> for us.

Amen..!!

> someone could tell me what the major decompacters are and where I can get
> them. I do have arcx.ttp however.

I'm assuming you've successfully moved the files from the Mac to the ST
using the Mac/IBM file transfer process..?

The file compression methods used on the ST are for the most part fully
compatible with the IBM versions of the same methods. That is, you can
interchangably compress and uncompress them on either machine. I know there
are Macintosh versions of these programs too, although I don't know what the
exact filenames are. You could obtain those and do the decompression
directly on the Mac if you wanted to.

As for the native ST applications, the ARC utility you already have is not
used very much these days, but there are still a lot of Atari files on
archives and BBSs that use this method, so it's good to have.

Other native ST methods include LZH (which is compatible with LHA.EXE on
the IBM) and ZIP (which is compatible with the IBM version).

Look in the Archivers directory on any Atari ftp archive site to find the
ST versions of these compression utilities. Also most local BBSs should
have the latest versions available.

The archive at atari.archive.umich.edu or one of its mirrors would be a
good place to look.

The ST506 is a previous standard to SCSI. You might well have an
ST506->SCSI adaptor. If so you can pick up a cheap ST506 based drive and
make it into a SCSI one AFAIK.

> What do I do? (I know, buy an ICD host adaptor.....)

Yup - as you still need a way of connecting the SCSI drives to the Atari.

:-)

Roland.

@CiX

PS AFAIK ST506 were the first standard of drives used in PCs. They had two
data cables as opposed to the single one of the later IDE and EIDE ones.
They weren't very big - and were quite slow.

>(What is an ST506 anyway? some sort of non-embedded SCSI drive I presume?)

ST506 was the interface used on the original IBM XT. You might be able to
find a drive from one of the advertisers in Micro Mart, however, if I was
you I'd get a host adaptor, eg. ICD Link, for the SCSI drive instead.

I think its safe to assume the headset exists and is fully working. I am
sceptical however as to what (if any) VR software Atari will launch that
is any good (rather than just crappy 3D graphics).

I suspected as much. When Windows NT needs 16 megs, and I use SL with 14 megs on my Falcon...well...do the math! :-) Unfortunately, business concerns may dictate getting the SL/NT version. On the other hand, by the time you add up the cost of all that PC equipment, I could get a 1200 DPI laser and/or a dye sub printer. And do most of my own final copy. How much are used Ultrasetters selling for these days? Believe me, Jens, I would rather NOT have to deal with Microsoft! :-)

3177. TrueImage

Newsgroup: comp.sys.atari.st
Date: 1995-05-20 00:00:00 UTC
From: Doug.Byfield@miramax.ship.net
Message-ID: <103_9505210114@direct.ca>
Source record: 165229

I recently purchased TrueImage from Falcon Systems in New
Westminster, British Columbia, Canada. (604-522-2915 Voice)
While I am impressed and love the program, I can't seem to
locate the serial # of my copy! I am a registered owner of
Lattice C 5.6, DevpacDSP, Harlekin2, Truepaint, Clarity Falcon,
Diamond Back 3, Diamond Edge and probably a couple more that
I have forgotten at the moment. Thus I am very familiar with
your convention of locating the product serial # on the reverse
side of the disk label on master disk #1. However, there is no
serial # printed anywhere: not in the manual, on the disks, or
on the registration card. I even tried using the memory editor
in Harlekin to try and locate an imbedded serial # within
the program. However, nothing remotely resembling a serial #
was found. I am not sure if this copy of TrueImage came directly
from Hisoft or from Oregon Research, as the normal ORE sticker was
not on the box or manual. Therefore, I am sending this email to
both Hisoft and Oregon Research. Thanks in advance, your help is
appreciated.

Yours

High density discs are rated as 2.0 megabytes *unformatted*. A disc manufacturer can not tell just how a disc will be formatted by the user, so the 2.0 megabytes is considered the MAXIMUM capacity possible. (Some computers format discs differently to give more space - the 800k Apple Macintosh, the 880k A-meagre and so forth, on "1.0 megabyte" discs).

Consider that a disc is like a carpark. Without putting lines down, chaos reigns. Once you had parked your car, you would be unable to find it again (instead of "aisle three, fourth car from the end", it would be "it's out there somewhere").

In reality, however, on a disc, you also need to put down "You are on track 34" signposts, "That was sector 13" markers, as well as "All the cars in that sector total 1485" error checking (CRC - Cyclic Redundancy Check).

It is this extra data that consumes the extra space. The book "Atari ST Drives inside And Out" by Abacus/DataBecker (which deals exclusively with the Double Density 720k discs) shows just how this data is arranged. By shortening the size of the "signposts", one can alter the format of a disc.

This is dangerous, however, as your formatting software must talk directly to the disc controller in your computer to do so - change the controller, and your software may not necessarily work. Not to mention that the disc controller or disc drive in your computer may just support your "illegal" hacks, but perhaps no one else can read the data on your disc - not good if it happens to be a backup you need to restore onto your new replacement machine after the old one blew up.

However, under a multitasker like MultiTOS, certain "cheating the system" software can fail, or produce unreliable discs. I find that 21-sector formats by FastCopy are just too unreliable (even on expensive "big name, never fail" 3M diskettes). Data written yesterday may not always read back exactly the same as it was written.

Under MonoTOS, similar problems can occur.

Once the disc has been prepared by formatting it, you can then begin to store information on it.

But to do so reliably, the operating system must be able to locate the data again as well. So it allocates a "disc contents" area. The way this is done will differ from computer to computer. This is part of the reason why you can't read a Macintosh disc on your ST without using the EXCELLENT Dave Small SpectreGCR.

On an Atari, PC, and some other computers there are three parts to this : Boot sector (also known as the "Master Boot Record" in MessyDOS lingo), a "File Allocation Table" (FAT) to store details of which blocks on the disc are empty/in-use/badly-mangled, and a Directory, storing the names of files on the disc.

A freshly formatted high density disc (with no "disc contents" written to it), can store 80*18*2*512 (80 tracks, 18 sectors per track, 2 sides, 512 bytes per sector) for a total of 1474560 bytes. Subtracting the boot sector, FAT and directory, you are left with 1458176 bytes (TOS 3.06 and the Falcon do 1k more). So a 1440k disc (1474560 bytes, which is really about 1.4 megs) is reduced to 1424k.

The "painted lines and signposts" take up the bulk of the space. The 600k taken up by this makes the 16k Bootsector/FAT/Directory pale into insignificance.

I've only found one key so far, it is the RED key (which opens the toilet
on the first floor and a room on the second floor). It is on the third floor,
at the end of a long corridor. Also in that room: a bomb. (the one you drop
with the TAB). I tried dropping it, but it just disappeared.

I spent an hour (over several games) trying to get out of the messhall, where
you get the autogun. Finaly figured it out.

Watch out for the toilet: it contains a new monster, but also a medikit
(which has the same effect as food, only more so).

>>Also, you cann't pick up the flame throwers :(
>Right. Can't go anywhere in the elevator either - hmm, maybe that's it.
Press 2 or 3 on the KEYPAD to go to second and third level (is the final
game going to have only 3 levels or will they change the controls? Hmmmm).

I wish I could afford the time to play this game properly. I'd get the money
somehow...

----Stuff deleted concerning SpeedoGDOS------

I have been told that STalker only handles Monospace fonts. This mean you will
have to use the included GDOS and config the GEMSYS file with fonts that have
the *.FNT at the end of it. Then type these names into the ASSIGN.SYS file to
load them for use.

Works for me. However, your milage may very.

3186. MiNTNet and SLIP

Newsgroup: comp.sys.atari.st
Date: 1995-05-20 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <3pl21e$o6t@gti.gti.net>
Source record: 165238

I am having some troubles getting SLIP going, and wanted to ask if anyone can give me a hint...

First, I downloaded MiNT 1.12, and that runs fine. Then I downloaded NET-070, and put the SOCKDEV and the SLIP in my MultiTOS directory, and rebooting tells me 4 SLIP and 4 PPP channels, so I am assuming that works fine.

Next, I downloaded dip, since I've used that many times on my Linux machine, but when I run dip -t it tells me 'you do not exist. go away'...

So finally, I tried the directions that was part of the README.SLIP inside NET-070. Seems simple enough: start the loopback device first, then start the comm session to create the connection, and run slattach. Nothing gives me an error, but when I try telnet, it never makes a connection. Since I don't know if my resolv.conf is correct, I am not using any hostnames at this point, just IP numbers.

Can someone lend a hand? Thanx

I have a feeling this is a bug that is fixed in some diff (I think it might be
a MiNT problem rather than MinixFS).

On the desktop and most replacement desktops, if you top window A and then double-click on a program in window B whilst holding the right-mouse-button down, the the program will run with the current directory set to A. This is really invaluable but I can't get Thing to do it, it just changes the mouse cursor to a hand thinking I want to move the directory listing.

Also is there a way to get the directory listings a bit neater, on my Minix partition I get:

quite.a.long.filename. 1234

Which is really irritating as then I can can't see both the name and the size with one other window on the screen.

Warp 9 came with my 'puter, how well does NVDI run on a 1mb machine?

Upgrading my TOS is the least of my worries.

> Looks like you have a dumb Auto folder....!!!

I'm a simple person, I'm using a 520ST with TOS 1.0 and 1 meg ram, I'm having trouble getting my harddrive to auto boot, so my 'puter is booting off a floppy at the moment, I'm using ancient hardware, most of which I got free, that won't let me cold-boot directly off a hard drive anyway*, so I need* ICDBOOT in drive A: autofolder.

I'm using an original ICD STHD SCSI host adapter, with three MFM drives connected to Xebec SASI controllers, I'm using ICD utils ver 6.0.7, which no longer supports SASI controllers, so I can't reformat/repartition/set autoboot/park any of my hard drives, my C: boot partition is currently has a bad sector where the main FAT table is stored so I can't store anything on that partition, and i can't reformat the drive so it no longer uses that sector for the FAT. So in other words I NEED A COPY OF ICD UTILS OLDER THAN VER 4.6!

I have yet to fool with the Supra utils I have, they supposefly support SASI controllers...

3195. Scanner driver for Falcon?

Newsgroup: comp.sys.atari.st
Date: 1995-05-20 00:00:00 UTC
From: lamarth@delphi.com
Message-ID: <BK8ebl2.lamarth@delphi.com>
Source record: 165247

I had a question on scanners for Falcons- are there any drivers out there (either freeware or commercial) that would run any SCSI-based flatbed scanners? If so, what brands/models scanners will they work with? Oh, and when I say 'driver', I mean something that will simply pull in a image into a standard format (GIF, JPG, whatever) and save it to disk.

Thanks in advance....

David (lamarth@delphi.com)

Hello all,
I feel this may be a stupid question but I was once told no question is
stupid, just stupid answers. :-)

Is there any kind of limit on the size of a hard drive for an AtariST?
I never owned nor worked with hard drives before so any explanation of
what a "partition" is and what "hard drive utilities" I may need would
be appreciated. I'd like to really get a large (540MB-730MB) hard
drive and fill it up with games, programs I write, and other stuff.
Any help would be appreciated. Thanks.

TM> cache is so flakey? Even booting directly from floppy with nothing
TM> in memory it's sometimes on and sometimes off. And it might be on
TM> when I boot, but go off later.

Ok, I thought I'd replied - but I'm never sure all of my messages actually reach their destination! (There have been a few down-links at this end recently).

Anyway - to keep to the point, how do you know your cache is turning on and off when you have no software installed? Are you just going by speed or do you load up some other program to check it?

If you are sure it's switching itself off even on a clean desktop with no accs & autos then it can only be either your TOS version or a hardware fault. I very much doubt such a hardware fault could occur -especially since the cache is internal to the CPU. It is much more likely that the chip would burn out completely if something went wrong.

It is possible your TOS version is messing with the cache during interrupts or system rom-calls. What TOS do you have? Do you have any additional hardware like accelerators or other such enhancements?

Any info would help my reply.

Cheers,

Doug.

I don't know if this has been asked before, but what would be involved in making a little black box that would allow you to plug a PC serial mouse into the ST mouseport? Has anyone ever done it? Is there docs for this hack somewhere? Or does it already exist? I'm not interested in pluggging a serial mouse into my serial port because I only have one and it's constantly being used by my modem. I assume it is possible, and could be about the size of a MouseMaster or even smaller. Any info would be greatly appreciated.

Whats worse AFAIC is if there *isn't* a maths cop-pro in the system. This is the normal case for most Ataris - and yet adding autodetect FPU code will actually *slow* the program down where it can least afford it.

:-(

: Leslie

No, no, no, it's not the driver (no offense). It's the TOS ROM searching
for the IDE. Almost every Atari FTP sight has a Falcon utility called
something like "Falcon-fast-boot", or something to that effect.
Basically, it turns off the scanning for the IDE hard disk and I think
turns off the IDE controller completely. I believe it installs a small
booter in the floppy boot sector before any hard disk is scanned for.
From what I hear, it works beautifully.

Good luck

Rich

Jim, sure its possible. However, it will take some surgery. The
NOS/Oasis package was written specifically for the Demon system. Its
installation etc. are only for it. However, as with NOS, I have been
able to get it to work with my PPP connection here in San Diego.
However, I do not use it as my Telnet dialup has excellent Usenet, FTP,
Email, and Web browsers right on line that far surpass NOS or Oasis.
Sure I have to use VT102 and Zmodem to transfer and it is an extra step,
but I have 60 hours at $23 a month and free 4 megs of storage with $0.30
charges for each meg above that after 4am. It's not worth it to me to
bother with it. If I want to use a nice Web browser, then I just use my
PowerMac down at the office with all of its free software.

I think MiNTnet is a better choice from what I hear. Its more generic to
set up (although still a nightmare).

My Falcon is my favorite computer for programming and ordinary use.
However, it just plain sucks for Internet software. Mac's and PC's have
a monopoloy in that arena. Setting up software for my PowerMac took
twenty minutes and that's it. When I have the opportunity (not often, it
does other things) I use it for "netting". I just wish the Atari's were
as easy to "net" with. It wouldn't be too hard for a Falcon to do. It's
graphics and GUI are very similar to a Mac's. Porting software over
would not be difficult (if you had the source to the Mac's software).

Yes, I'm rambling...sorry.

Good luck,

Rich

I think it is - where you fly around the universe and pick up cryogens and other "pods" for a growing colony. I got stuck near the end as I couldn't find the last cryogen pod - I searched the whole universe twice (apart from the last place that I don't think you are supossed to go to until the very end) and still couldn't find it.

By the way there are two planets quite close were you can buy guns (actual guns- not a pod) and fill up you ship with them, then sell them at another planet for an absolute killing!

There are quite a few PD progs that will let you view .gif pictures.
Pchrome, Speed of Light & Gem View are a few I can think of off the top of my
head!
Pchrome is great to veiw them using the full Atari range of colours, and you can
save the pics out as Spectrum 512 pics.
Gem View & Speed of Light, I believe reduce the colours down to the current res
amount (4 or 16), but will let you manipulate the pic a bit more.

Hope this helps.
Ade.

: : KA9Q / NOS or MiNT-net with Unix Telnet & Ftp.

: CAn I use MiNT-net from inside GEM or do I have ot set up MiNT + X?

You can use MINTnet within GEM, so long as you have MINT (as the name
implies). Unfortunately, it seems to be mildly painful... I downloaded
net-070, which includes socket and SLIP drivers, and they work fine.
I had a pain in the ass getting a SLIP connection going. I eventually
ended up downloading MINT-OS, which gives me an init environment,
logging in as root and running dip. From there it was a simple matter
of getting telnet and lynx...

KA9Q, IMHO, is doubly painful, since it uses a nasty internal
command set, where dip uses some very easy to remember commands

3228. no!desk 3.02 problems.

Newsgroup: comp.sys.atari.st
Date: 1995-05-21 00:00:00 UTC
From: dbrewood@nest.demon.co.uk
Message-ID: <1557dbrewood@nest.demon.co.uk>
Source record: 165153

I'm trying to run No!Desk 3.02 on a TOS 4.02 Falcon and am experiencing the following problems:

- When using Stoop to auto-boot No!Desk I get an altert box saying that it can't find the .OVL file despite the file being in the H:\NOSYS\ directory, which all other files are contained within. If I OK the warning alert and then let the system drop back to the TOS desktop and then run NODESK.PRG manually all is just fine.

- When selecting the 'install applications' menu I only get 5 file masks, and can't find a way of adding more.

- The desktop directory windows under No!Desk seem to be stuck in the grey colour, is there any way of changing these at all? WinColor 1.5 seems to be ignored by No!Desk.

If any kind soul can advise a way around these problems it would be greatly appreciated.

Daron - dbrewood@nest.demon.co.uk

I just downloaded the English version of Tcache from GEnie and am pretty impressed with the docs. I was wondering if anyone would like to share their own experiences with it? How do you like it? Any drawbacks? How does it compare with ICD's cache (if you know)? Anything at all you can share.

3230. Linux & CD-ROM

Newsgroup: comp.sys.atari.st
Date: 1995-05-21 00:00:00 UTC
From: christian.mittendorf@ostkupan.ct.se
Message-ID: <ftn_2.203.202.11$fidonet.org_2fbf1bfe_Christian.Mittendorf@ostkupan.ct.se>
Source record: 165155

Hej!

I got my first Linux now installed and most things work just fine.
But there is one problem I have is my CD-ROM. Hopefully somebody here can give
me a hint how to solve it.

I have Linux 0.9.5 PL18 and while booting I get the following message:

```
[...]
scsi0 : Atari native SCSI
scsi : 1 hosts.
Vendor: PHILIPS Model: CDF080 Rev: 1.5
Type: CD-ROM ANSI SCSI revision: 02
Detected scsi CD-ROM sr0 at scsi0, id 0, lun 0
scsi : detected 0 SCSI disks 1 CD-ROM drive total.
Scd sectorsize = 2048 bytes
[...]
```

So I get my CD-ROM recognized and I have included the following in my fstab:

```
[...]
/dev/sr0 /mnt/cdrom iso9660 ro
[...]
```

But while trying to mount /dev/sr0 I get the following message:

```
[...]
isofs_read_super: bread failed, dev 0xb00 iso_blknum 16
[...]
```

Any hint what I could have done wrong? Or is it a problem of my CD-Rom or
perhaps the kernel?

mvh,
christian

P.S. BTW, how much diskspace is needed for a minimal(!) X-Win system?

(UUCP Dialup connection)

IT> Right, and the fast route to RSI

It seems as if Joypad control will be included in the commercial version.

IT> What can you do with the computer terminals?

Haven't solved that little riddle yet.

>> Also, you cann't pick up the flame throwers :(

Nor this one.

IT> Right. Can't go anywhere in the elevator either - hmm, maybe that's
IT> it.

There's a textfile included with the demo that explains the controls. In order to use the elevator to change levels, you enter the elevator and when the door closes you press 1,2 or three on the numeric keypad to go to the corresponding level. There's a keycard on level three that allows entry into the locked room opposite the elevator on level 1.

Hmm, for Intel processors this is quite normal, but for Motorola ???
My 68030 in the TT gets about 30-40 degrees and it's running 32 Mhz, I
guess the 16 MHz processor in the Mega STE isn't a real 16 Mhz one or is
not Motorola... Anyway, a small heatsink may solve the problem.

Hmm.. I don't think that would work since the disk needs to be bootable,
and you'd need a running copy of DOS to create a boot disk so you could
boot into DOS... catch 22...

Not to mention DOS isn't "PD".

(Surely someone at the University of Chicago could make you a "backup" disk?)

3239. ACSI, 'CCC Learning Station' -- help, please...

Newsgroup: comp.sys.atari.st
Date: 1995-05-22 00:00:00 UTC
From: adhst2+@pitt.edu
Message-ID: <3pqv72$6ev@usenet.srv.cis.pitt.edu>
Source record: 165052

I just acquired a couple of 1040STfm's, and they came with monitor stands which are labeled 'CCC Learning Station'. Apparently they were from a middle school down south somewhere. On the underside of these stands is a box, about 6" x 8" or so, labeled as:

ACSI Model II
PCB Rev

There is an 8-bit DIP switch and three female sockets which accept Atari HD cables (one on the same side as the DIP, two on the other).

Does anybody know what these are, and what I can do with them?

Could this be some kind of file server system?

3244. advice offered + advice sought

Newsgroup: comp.sys.atari.st
Date: 1995-05-22 00:00:00 UTC
From: rosenkra@convex.com
Message-ID: <3prnqb$1mi@convex1.convex.com>
Source record: 165057

on the subject of WYSIWYG vs LaTeX (really GUI vs text UI):

canons for software/hardware selection:
1) use what works best for you.
2) use the right tool for the job.
3) periodically sample alternatives to optimize 1) and 2).
4) avoid arguments over "my X is better than your Y", even if
X is widely believed to satisfy 2), because you can't possibly
know that X satisfies someone's 1), nor do you know which is
more important.
5) seek and value advice from experts; respect experience; you can't
possibly know everything.
6) never limit your options; always consider the big picture.

best: offers advantages; ameliorates problems; reduces stress or
gives comfort
right: satisfies requirements; offers advantages; optimizes

personally, i use troff (DWB) under unix (95%), wordperfect on PC (3%),
and word on a Mac (2%). this currently optimizes 1) and 2) for me. i
use wp and word because i have to. i use DWB because i know it well,
i can get postscript output, it has been standard on unix, i can use
emacs and not have to learn another editor, i can easily reuse prior
documents, i don't do DTP, and it does the job for me.

[stepping off the soapbox now, seeking your advice...]

since my mega4ST bit the dust, i was forced to go back to my 1986 1040ST.
for what i use it for (vt100 dialup terminal to work via uniterm) it is
totally adequate.

however, i am considering a replacement, if only to insure that if the
1040 goes south, i am not scrambling for a replacement. i am considering
either a falcon or another PC (i have a beefy 486 now, but it is in the
basement running my midi studio -- my work office is upstairs in a spare
bedroom). i am still considering the falcon, eventhough it is my under-
standing that atari no longer makes them (correct me if i am wrong on
this) because:

- i am very familiar with programming ST's (i have not written
one line of windows code :-).
- i have been very satisfied with ST's, mostly since it has
been possible to create a unix-like environment (thanx to people
like bammi, esmith, et al).
- i might find it useful for audio applications.

so, i have some questions (i have these covered for the PC world, though compare/contrast would be helpful, too):

1) where can i get one (new)? does toad carry them? (i am very familiar with toad, formerly living about 5 miles south of severna park.) is it C-Lab that makes them now?

2) in the past, i seem to mostly wear out floppy drives on STs and have probably replaced 5 or 6 of them in the past 9 years (not bad, i suppose). so i would expect the same on the falcon. i would probably look into buying 2-3 up front for the inevitable (and questionable future of the falcon). are these readily available, are they "specials" or would a generic 3.5" drive from say CompUSA work (and if so, any mods needed and what would they be -- jumpers, etc)?

3) i have a toadfile 150 (circa 1991, i think). it has an ICD host adapter though i forget which one. in the cabinet, i also have a floptical drive. i interface the toadfile unit to the ST via ACSI. can i use this on the falcon as-is or would i need a new host adapter? if so, which one?

4) what cpu upgrade options do i have (faster clock, better cpu, etc)? how do these perform say on compiles and graphics? are they really worth it? (here i mean at least 2x improvement over standard system.) what is the normal cpu in the falcon and its clock speed?

5) i'd probably be looking into a 15" monitor (i have a 17" MAG on my 486 which is really nice). what are my options here in general? what would be a decent monitor, considering i would be sitting in front of it for ~10 hours a day? i find the SM124 (now SM144, i think) to be excellent as far as eye fatigue is concerned. this factor would be my highest concern. how would this monitor be interfaced to the falcon? might as well include ballpark pricing as well. $500 range is what i am thinking at this point.

6) i prefer a detached keyboard as on the mega4ST. in fact, IMHO, that keyboard is probably the best i have used in 20 years of computer use, both for key layout and key action (mainly the former). what options do i have for this, including adapting the mega4 keyboard? eg, tower cases, etc. if a tower case, could i gut the toadfile 150 and place its contents (3.5"/half harddrive, 3.5"/half floptical, host adapter, power supply) in the tower (or minitower)? note that i think the mega4 cable is relatively short.

7) i would probably opt for maximum memory. is that 14MB? should/can i buy a lesser config and buy memory from another source? if so, what exactly should i be looking for (access/cycle time, size; part number and source would be optimal)? i am not worried about saving $50 if it means hassles later on. $200 saving might be different. but at $40/MB, that is $560.

8) i would want a SCSI or SCSI-2 port. is this standard, and if so, what flavor of SCSI is it (SCSI, SCSI-2, FAST, WIDE, FAST+WIDE, etc)? if not, how do i go about getting SCSI? note that the SCSI requirement

is mainly driven by requirements to transfer data between a sampler
(synth) and the system. also note that the toadfile 150 has an external
SCSI port. could i use that off the existing IDC host adapter?
while i am at it, is CD-ROM a possibility on the falcon? is ISO 9660
(or whatever the standard is) supported?

9) a major use of the system will be as a VT100 terminal to connect to
work. uniterm has been almost perfect for this, both for VT100 emulation
(it is as far as i can tell perfect there) and also for file transfer
(i use kermit, though downloading is much slower than uploading).
i currently have a practical peripherals PM14400FXMT fax modem that
i operate at 9600 baud. this is of course external (RS-232). (the host
i connect to is limited to 9600, so don't please don't tell me about
faster modems, etc.) i would love to continue to use uniterm (2.0e)
if possible. is it possible? if so, how? if not, what would be a good
terminal program that gets VT100 right? ideally, i'd like the term
to be the entire screen (which would be super on a 15" monitor, just
like an old sun 3 w/s i used to use). i would perfer a character size
no smaller than what i get on SM124 or SM144. if the term is in a
window, could i resize the window the entire screen, and if so, could
i keep the 80x24 aspect ratio, essentially increasing character size,
as well as having the option to set say 132x40 (assuming i can hack
a termcap on the other end)? what about fax support?

a) i will eventually buy either a laser printer or an HP deskjet (560C
or similar). i'd more than likely run something like ghostscript
(which works fine on my 486). 2 applications i can think of include
printing postscript documents and getting hardcopies of faxes (see
above). is this possible and how?

b) finally, also in the music use vein, i would want to add digital i/o
(either AES/EBU or SP/DIF). what are my options here, including cost
and software? at a minimum, i would want low level drivers so that
i could write my own applications. the main application i can think
of so far is moving stuff back and forth from my Tascam DA-30 or DA-88.
this of course also implies eventually getting a decent size disk
(at least 0.5GB, SCSI). one of the things i would be looking to do
is record some old albums (vinyl) that will never make it to CD, clean
up the pops and scratches, and then move them back to DAT (and possibly
CD after that). is there software for this now? if not, would i have
enough drivers and low level stuff (and documentation, in english)
to be able to at least transfer DAT->falcon disk (BGEM partition or
minixfs) and back again?

c) oh, one more thing: gcc is my compiler of choice, though with only 1MB
on the 1040, i have not touched it in quite a while. what is the current
status of gcc? i think i have something like 2.1 or so now. what
support for the 56k chip is there (assembler, etc)? is it possible to
write a GEM application that uses the 56k with gcc only? ie, do i have
to get some other development system? if so, what would i get and is
it compatible with gcc? ie, can i link gcc .o's with this other system's

.o's? does gcc produce code for the 680x0 in the falcon? what about
if i upgraded the cpu, assuming this were possible? briefly, how do
you write applications that make use of the 56k?

d) and yet another: would a network be something i should consider? i
would want a PC<->falcon LAN. i'd want to transfer files (as in
FTP). possibly also a terminal session (say csh in either direction).
is this viable? cable run would be something like 30 feet.

any other issues i might have overlooked or that i should consider?

my budget is say $2500. for this i could get a P5-75/16MB/PCI/15"/540MB
or 486DX4-100 PC. i am not considering a Mac, though it would be optimal
for music. this system will be used primarily for work.

note that i'd prefer to procure as much of this from US suppliers (mainly
for convenience). i have no problems with buying from overseas or canada.
(in fact, living in detroit area, i am only about 10 miles north of
windsor -- yes, north. :-)

sorry for the length of this. and thanx for helping. i'd prefer email
responses if possible (rosenkra@convex.com). here is your chance to
keep a long-time atari user a longer-time atari user (only don't be
too obnoxious, ok? :-).

incidently, if i do write any interesting stuff for the falcon, i'll
more than likely pass it along....

3245. NOS with dynamic addresses

Newsgroup: comp.sys.atari.st
Date: 1995-05-22 00:00:00 UTC
From: bbeck@lilfort.mlnet.com
Message-ID: <FEWUEHBXUP@lilfort.mlnet.com>
Source record: 165058

How to get Demon Nos to work with dynamic addresses

1) I have had to configure NOS to use SLIP instead of PPP. I just
can't seem to hold a carrier using PPP. If your STARTUP.NOS file is
configured to use PPP just comment out all of the PPP parameters
and change the attach line to:

attach asy AUX: 0 slip sl0 32767 576 19200

2) DO NOT use the built in dialer with NOS. Comment out the dial line
in STARTUP.NOS. Use a seperate comms program, one that doesn't hang
up the line when you quit the program and also has a built in text
editor. (Storm, Freeze Dried Terminal, etc.)

3) Run your comms program and load the STARTUP.NOS file into the text
editor. Dial your provider and log in.

4) When you get your ip address go to the text editor and change the
line with your ip address to the one just assigned to you, and save
the file.

4) Quit your comms program and run DEMON.TOS. When you reach the main
menu press A and you should be connected. To test if you are, at the
net> prompt type: ping XXXXX.XXXXXX.XXXXXX (replace the x's with
your domain name sever name). You should see something like rtt:220.

Note: I have had to edit my active file and nntp.dat files by hand. i have
also not been able to get my mail delivered to me although I have no
problem mailing out. FTP and telnet work fine.

The newsest version of NOS, version 0.42 I think, is supposed to be able
to negotiate an ip address with your provider using PPP although I have been
able to get this to work. It also has paging during ftp sessions so a whole
directory does not scroll by. It is available at disabuse.demon.co.uk

If you have any problems feel free to email me at:

bbeck@lilfort.mlnet.com

Good! That is a big step in the right direction.

>The graphics in the final game include a lot more monsters and other
>scenery but in order to keep up the speed the scenery doesn't change
>that much but the rendering is much improved.
Is there still time to make changes? If not take it and get it right
otherwise I don't think you are going to sell many and that would be
bad for all of us.

How about:

Putting some simple colour on those boring walls, or floors or
ceilings - preferably all three. If it wasn't for the squashed
monsters and the occasional button I would think it was a mono
game. Maybe a mono game might be better anyway, using
textures, would that free any cycles?

Rereleasing the demo with the joystick and mouse support. My
fingers won't take any more cursor pressing, and pain ain't
a good selling point.

I really was impressed with Obsession, for anyone who likes pinballs
check it out. I know those Unique people can do it right - I hope they
can do it again.

BTW in desperation I RTFM and discovered that the elevator controls
are documented, thanks to all those who took the trouble to let me
know.

John 'john..' Tuffen (jat5@york.ac.uk) wrote:
[snip]
> (What is an ST506 anyway? some sort of non-embedded SCSI drive I presume?)

An ST506 drive is as follows :
Seagate
Technologies
5 1/4 inch
06 megabytes unformatted

I might be wrong - it could be an 8-inch drive - havent seen one for aeons

All Seagate drive names can be broken up in this manner :
ST = Seagate Technologies
x = Form factor of device
1 = 3.5 inch Half height
4 = 5.25 inch, full height (?)
5 = 5.25 inch, full height (?)
9 = 2.5 inch, (Half height?)
yyy = _Unformatted_ capacity
(This may be followed by A, N, R or some other single letter)
N = SCSI
A = AT-Bus (IDE)
R = RLL

(There was a text file available a few years ago which documented this,
giving many more values than I've written above - purely from memory -
but, unfortunately it has since become a tad lost/destroyed/invisible.)

The ST157N in my TT is a 3.5in, half height, 57MB unformatted SCSI.
The ST5065 in my Megafile60 is a 5.25 inch, half height, 65MB unformatted.

Unfortunately, I can't recall any other drive manufacturer sticking to
this, or any similar naming scheme. A pity - it really does make it
easier to know what a drive is before even seeing it "in the flesh".

Hi There,

I have a Megafile 60 Atari Hard Disk Drive and I was wanting to know what
the latest version of the driver software was available and where ...

I'm currently running AHDI v3 (1989) and I did have v5.0 a wee while ago,
but I dropped it for favour of the previous version, because I knew that
it worked.

Heaps o' help appreciated!

: Any help would be appreciated. Thanks.

The maximum limit (which no one is ever likely to need to reach), under ICD Utilities using maximum size BGM partitions (512mb per partition, 14 partitions) is 7 gigabytes. Therefore, you'll have no trouble with a meansly 540 megger. :-)

: A jump through a vector (set by the initialisation code) would be quicker.

: That's how I'd do it (IF I were capable that is :)

At the start of the program have a check to see if the FPU is in
place.
If it is not there then change the LINE_F vector to your emulation
code (which you have with the program as a matter of course). This
check will only occur once in each execution and will incur no
overheads to the system from then on.

Beric..

I agree with you.

>> The author of TeX has spent his time on
>> implementing typographically correct algorithms

> Which, when it comes to the market, no one could give a hoot about.

I don't believe my eyes. I *hope* you meant this sarcastically?
I don't care what the market wants. What *I* want are typographically
correct documents.

> The system that makes a nice looking output is the correct system. Period.

I'm beginning to think you *did* mean this. To quote a bit from the
`Why LaTeX'-part of the LaTeX-documentation: `Documents are to be
read, not hung in museums'. A folder is meant to catch the eye, but I
get a headache from having to read that style in a *real* book.

>> instead of focusing on a flashy GUI (but this is < 1980 stuff).

> GUI has NOTHING to do with it. It's usability. The fact that the Mac
>was the first machine that put it all in one place (and later the Atari,
>PC's etc.) is why people relate the two.

Hmmm. I can work with LaTeX fine. I don't need a GUI for that. But
I agree that it can make things easier.

>> Frankly, I don't care whether you find TeX hard to use. I don't
>> care how easy it is with your WYSIWYG WP to create an awful page
>> in just a few seconds.

> I can create a superb page in seconds too. I can create a better

Ah. Then you must know something about typography. In that case, the
majority of my arguments aren't valid. I was talking about the vast
majority of people who, with the arrival of easy-to-use DTP software,
spend their time producing awful documents --- and don't even know it.

>looking document in a minute that you can in TeX period.

Define `better looking'. As I stated before, I don't care too much
about the aesthetical value of my documents. Not that it can't be nice
to have an aesthetically pleasing page sometimes, but I'd rather look
at a painting instead. Documents are to be read.

> There's the same comment again. People who don't use TeX can't design.
>The two are completely unrelated I'm sorry to say.

Please don't get me wrong! I wouldn't want to insult those innumerous
designers not using TeX. I'm just trying to say that people who can't
design could better use TeX instead of doing-it-themselves, but wrong.

As a matter of fact, I do notice that people with experience in TeX
get to appreciate good typography after a while, and start to realize
what it is that makes some texts awful to read and others very
pleasing (not taking the contents into account, of course).

>> don't care whether you can produce an ugly screaming yellow-on-pink,
>> shaded, rotated, skewed section head with a GIF texture-mapped onto
>> every `o' in it. I want readable, typographically correct documents.

> And again. You can make "readable, typographically correct documents"
>in any of the commercial packages, and spend less time both learning and
>constructing.

_If_ you already know what makes a document readable and
typographically correct. Most people don't.

>>> Oh that's BS and you know it. Making a table in my WP takes seconds.
>> I didn't write that, check your sources before you flame someone.
> I wasn't flaming you, I was flaming the other guy.

I'll give you the benefit of the doubt here. It sure looked as if you
were addressing me.

>>> Would you use TeX to make a 3 page picture pamphlet? Probably not, it's
>>> not what it's for. However, you can do this AND formulas in FrameMaker.
>>> And a lot of other things too.

>> something it's not meant for? No? Well, I have program YYY here that
>> does a better job at it. So it's better than XXX.'

> No, what I am saying here is that TeX does a few things well. Other
>packages do all of that, and a lot more.

Again: If _you_ know what to do with them, they're fine. As a matter
of fact, if you _are_ a skilled designer, you'd probably like a visual
formatting package a lot better.

> I wrote one of my projects (on plasma confinement) in TeX. After
>leaving school I rewrote it in MacWrite with a formula editor. I can't
>describe how much easier and faster it was, and the results looked BETTER
>because I could EASILY tweak what I didn't like.

I don't know MacWrite nor did I see any output of it, so I can't
comment on this. I must say, though, that the lecture notes we get
fall into one of two categories: either produced with (La)TeX or
looking awful. Again, I don't want to refute the fact that you _can_
create good documents with a visual formatter, I just want to stress
that you need to know exactly what you're doing in that case.

>> These are the days of `I know everything about everything. I *know*

>like. These are the days of placing text around pictures in seconds.
>These are the days of doing colour matching and font selection on the
>fly. These are the days of having your spell checking happen while you
>type.}

Note: I just made the above paragraph boldface. It wasn't so hard.
I just typed {\bf before it, and } after it. I bet that's even faster
than selecting the block with your mouse (thus leaving the keyboard)
and selecting the `font' menu, the `change appearance' menu, the
`boldface' menu, and the `are you sure' menu twice.

> These are the days when you don't have to be a programmer or rich to
>make a nice print.

Why does everybody insist you have to be a programmer to use LaTeX?
You absolutely don't. Thats rubbish. And it's a fact that FrameMaker
or any decent DTP package would set me back $$$, whereas LaTeX is
free. So your last argument is actually _in favor_ of LaTeX.

It was a computer which was around at the same time as the
Spectrum. My first computer was an Oric 1, and although it was a much
better computer than the Speccy, it didn't have much software support
(in those days, these were games), whereas the Speccy had a lot.

I assume you use TOS 4.0x, MultiTOS or WinX. With these, Thing allows back-
ground windows to be operated with the _left_ mouse button as well. If you
don't like this behaviour, disable the option "Hintergrundbedienung" (or
the corresponding english word, should be sth like "background operation")
in the "windows"-section. Then you may use the right button just as in
the other desktops you've mentioned.

> Also is there a way to get the directory listings a bit neater, on my Minix

> size with one other window on the screen.
Well, with Thing 0.41 (still beta), the width of the filenames is determined
by the width of the longest filename in the current directory (AFAIR), so
this should look nicer.

Ciao

An Oric one is a little tiny 8-bit computer from about 1983!!
It was made by UK Company and seems to have sold around 250-300,000
units, although I doubt many people are still using them.

Cheers

I've been putzing around with Linux again, but didn't get very far. I downloaded the latest kernel (0.9pl5?) and the latest bootstrap (ataboot-05), and gave it a whirl, but nothing much happened... so I downloaded the RAM disk image (filesys-new), and tried that:

```
ataboot.ttp -k vmlinux -r filesys
```

and after giving me a few informational messages, the screen gets really neat, lots of random colours. I tried booting in 16 colour mode and hi-rez (ST-High), and with no AUTO programs, but the same deal in each configuration. Is this kernel binary runnable as-is on my Falcon? (I do have a 68882, I know that matters)

Okay, the World Wide Web/MinTNET package has now been finally released for sale by the Toronto Atari Federation's (TAF) 16/32 Bit Library; here's what it consists of:

TAF SPECIAL: XWINDOW (7-disk set)

"Included on these diskettes are: MINT, MINTnet, tsch, X-Window, PPP/SLIP, FTP, Telnet, Chimera (a Graphical World Wide Web Browser) and many more UNIX-like programs. The included installation program sets up a basic UNIX enviroment to connect to an Internet Service Provider using a dynamic PPP. To use these programs you need to have 4mB RAM and at least a 10 mB hard drive partition to be set up as a MiNT partition. You also need an UNZIP program and an ASCII text editor. An understanding of the UNIX enviroment is very useful."

The retail price of the package should be around $25.00 Canadian; I'll have to check on that to be sure.

Enquiries on the package should be made to:

TORONTO ATARI FEDERATION
5334 Yonge St., Suite 1527
Willowdale, Ontario, Canada
M2N 6M2

Attention: Bill Annand (16/32 club librarian)

Note to European Users - Danny from HENSA said he was also evaluating the package for his user group to be distributing.

>than selecting the block with your mouse (thus leaving the keyboard)
>and selecting the `font' menu, the `change appearance' menu, the
>`boldface' menu, and the `are you sure' menu twice.

OTOH, you had to position the cursor at the beginning of the paragraph,
type something, move the cursor to the end, then type something else...
And won't LaTeX also reformat the paragraph, so the '>'s in the
first column will probably end up elsewhere? :-)

: on a UNIX workstation and would like to use my falcon in the same manner.
: But I need help with the setup, so if there are anyone outthere with a
: falcon/Unix please help me.

Most of my time I work on a workstation too. I've set up a unix
environment on my 1040st, and it work just fine.

: Unix has a different filesystem with longer filenames and extensions,
: how to accomplish that?

1. Get mint. That's the kernel.
2. Get minixfs. You can build a filesystem with long filenames, users,
groups, etc...
3. Get mintos. That's the multi-user part.
4. Get mintnet for TCP networking.

You can get it by ftp - it's all over the globe.

: How to set up TCSH, with unixlike filetree?
: I would like to use following programs, how to get them and how to
: set them up in a perfect way, GCC,emacs,latex?

I myself use a recent bash, but I also have a sh, a tcsh and the zsh.
There are ports of gcc 2.6.1, emacs and latex available.

3282. Junk 1040ST for sale for parts

Newsgroup: comp.sys.atari.st
Date: 1995-05-22 00:00:00 UTC
From: troyc@bnr.ca
Message-ID: <3pqqah$6pl@batph8.bnr.ca>
Source record: 165195

I have an old 1040ST that I will sell for parts.

This ST DOES NOT HAVE:
Memory and
A Power Supply
Installed Disk Drive

Other than that, all chips are intact and were working
the last time I turned it on (before I yanked out the memory, of course).

Still available:
68000 CPU
DMA
GLUE
MMU
TOS 1.0
... you get the picture

I will also thrown in the working floppy drive. It was used as the
replacement for the original.

Make an offer.

> If anyone out there has got their USR 14400 running at full speed and
> as good as possible I'd like some tips and hints on setting it up.
> Thanks.

Push Connect up to the maximum speed supported on your Atari. At speeds over 14400 the modem will use compression to support the increased data rate. You will still get messages that the modem has connected at 14400 but in fact data rates can be much much higher. On a Falcon with no extra software or hardware I connect at 38400 and get a down load rate of about 3500 cps (raw text) and 1700 (compressed data)

From: smselick@ios.com
Message-ID: <3pqkgt$rdh@ios.com>
Source record: 165198

Hello All!

I have X running on a 1040STe w/4 megs, Mintos, Mintnet, X, 14.4 modem, and a minix partition (no wonder people have so much trouble getting it all started - that was a mouthfull!)

Anyway, I always get all sorts of errors about "cannot convert *-helvetica-*-*-*-120-*-*-*-*-* to type Fontstruct" and also similar color problems. How can I simply redirect all fonts to "fixed"? And all colors non-white to "black"?

Second, I heard that there are 2 programs which will speed up X operations by as much as 75%. One is lbx, or "low bandwith X" and the other is called sxpc, which offers an X code compression. Are either of these available for Atari X?

Thanks,
Steve
smselick@ios.com

P.S. If you are reading this to see if there's someone who can help you with X, I would be happy to answer any direct questions - please don't ask me "how do I get X running" though :)

Hmmmm I don't know about you, but when I buy a magazine I like to see the adverts in it. To some extent its the same on Usenet, I don't mind adverts so long as they are relevant (I didn't see this one so can't comment). Before people start shooting me down about 'I have to pay for my newsfeed and don't want c**p like this!' I'd still feel the same if I did have to pay for my newsfeed, and as of september this year I will do.

Is it so that your company needs NT for multiuser-network-security reasons? I suppose Ataris (like Mac's and WinDos's) are all too easily reconfigured and hacked to a stop of business by the average user.

> Believe me, Jens, I would rather NOT have to

3298. Towers II save game?

Newsgroup: comp.sys.atari.st
Date: 1995-05-23 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <3pu4dn$h8k@gti.gti.net>
Source record: 165011

I can't seem to save any games in Towers II, and was wondering
if anyone else ran into that problem. I would like to register,
but won't until I find out if it's just me, or a bug.

My system is a TOS 4.04 Falcon with 16mb of RAM, no other
nasty mods. I've tried booting with no AUTO programs and
the like, but to no avail. What happens is I click on the
disk icon, and select save game, and point at empty slot
one. The readme says that I will need to type in a name, so
I assume the 'empty slot' will disappear, but it doesn't.
In any event, I type in a save name, and press enter, and
the disk drive light goes on forever. I even let it sit for
15 minutes, JIC...

: I'm an active Oric 1 user, there are still 10's of thousands of us in the UK.
: I have just finshed a new Doom type game and am working on a new graphics and
: sound demo which I hope to release after my exams. If you are interested in
: getting into the scene then you can join Oric Users UK, I'm the chairman.

: There is plenty of PD software and quite a few commercial releases too. If you
: want more info contact me.

: Alan. ;-)

Yes, thats my point there are probably more Oric users than Falcon users!!

As for a doom type game, when I buy my oric :) (15 quid the last time
I saw one for sale) I'll get this doom game. I'll expect 16.7 million
colours, texture mapped graphics and 16bit, 16 channel stereo sound!!

Its just been released onto ftp.cnam.fr (it might still be in the
incoming direcotry), the filenames are lostblu1.zip to lostblu4.zip and
the event is Lazers Fried Bitz III winning demo for the Falcon030.
It requires 7meg on your hard drive, an RGB monitor and 3.7meg of memory
free and belive me it is worth it! Truly the most stunning demo ever
seen on an Atari machine. Its clever, perfectly synced to the music,
fast, furious, doesn't waste too long on one effect and is utterly amazing.

If you own a Falcon and have the means, get this demo now.
If you don't have FTP access then simply send 4 blank high density disks
in a self-addressed-stamped jiffy bag to the address below and I'll send
you a copy free of charge. Or if you can receive large emails (and I
mean large!) I'll send you a uuencoded copy of the demo, just give me
your email address.

Do not miss it. Lazer, you are the most talented group on the Atari
scene today.

Hallo Christian,

CM>Any hint what I could have done wrong? Or is it a problem of my CD-Rom
CM>or perhaps the kernel?

It seems like a problem of the kernel. Try an actual kernel up to patch 29. This new kernel have some bug-fixes for cd-roms, eventually it helps. You can get such a kernel via anonymous ftp from my server wctc6.chemie.uni-wuppertal.de (132.195.9.135) in pub/Linux68k.aktuell. This server was broken today, but now he is running, I hope. Tomorrow I will check the server for correct working.

Almost anywhere - there will be a lot going second-hand. I think the point of most people's answers was that, as you have to buy a host adapter anyway, you would be better connecting this to the embedded SCSI drive you have. It is more modern, faster and there will be less wiring and gubbins to go wrong. As an extension to this you could find a ST506 for peanuts to connect to the adapter which will give you another drive.

3304. Substation - not too hard

Newsgroup: comp.sys.atari.st
Date: 1995-05-23 00:00:00 UTC
From: Conan Ford <ford@freenet.calgary.ab.ca>
Message-ID: <Pine.A32.3.90.950523235358.13365A-100000@srv1.freenet.calgary.ab.ca>
Source record: 165017

Passing Substation Demo is fairly easy if you have played games like Doom. Except SubStation Demo is a lot more difficult than Doom II level 1. I passed the demo in about 10 plays. (Steve Wells: thanks for the help, but I figured it out before I got the reply).

A tip for the inexperienced: running backwards or sliding left/right is a lifesaver in fighting those guys who throw fireballs.

A big flaw (?) in the demo: The guys with the guns are much smarter than the Doom shotgun guys :).

: didn't recover from errors as CoNnect's Zmodem sometimes does. I used a
: 2400 bps modem then without hardware error correction, so you know the
: problem... One line error, and: let's try again..

The ANSI and VT100 support has not been changed in STalker. It is currently as good as it will get until version 4.x. The Zmodem has also been unchanged except to allow resume to work with Delphi.

: Otherwise I like STalker very much. It's better to use IMHO than ConNect,
: though the latter has more features.

There are features in CoNNect that will probably never go into STalker.

My immediate plans for STalker are better ANSI and VT100 support, changing the way the virtual terminal behaves, and some changes in the Dialer areas.

[...]

Turn off the option 'selection in background' in the setup - then you
can use the 'holding right buttond and click with left'-way ;-).

Otherwise you can use the left button _always_ (!) if you are using
MagiC, MultiTOS or WINX with SingleTOS - even in background windows!

>Also is there a way to get the directory listings a bit neater, on my Minix
>partition I get:
>
>quite.a.long.filename. 1234

This problem is fixed in Thing 0.4x - wich is not released yet but
already under beta test. I changed the procedure wich calculates
the coloumn widths - so it will produce much better output ... it will
look a bit like Gemini ;-).

Ciao...

** SURVEY ** SHOESTRING COMPUTERS ** SURVEY ** SHOESTRING COMPUTERS **

Here is a short survey to help me better determine the needs of current Atari users. I will use your answers to help point Shoestring Computers in the right direction. If there is anything that you feel I have overlooked, feel free to make additional comments at the end.

1) Which Atari ST series computer(s) do you have? If you have more than one please list them all. Also include your TOS version and RAM.

2) What is the primary use of your ST?

3) Secondary?

4) Which monitor(s) do you own?

5) Do you have any hardware upgrades installed in your computer(s)?

6) Do you own a hard drive? Please list the host adapter and the size of the drive as well as the driver software version you are using.

7) Do you own a modem? Please list the manufacturer as well as your primary telecommunications software. (If you don't own a modem, how did you get this survey? <smirk>)

8) Do you own a printer? Please list the manufacturer. Also list the RAM size if it is a laser printer.

9) Do you own any other peripherals?

A) Please name the last hardware purchase you made.

B) Please name your three most wanted hardware items, including upgrades (available OR unavailable).

C) Please name your top three software applications (no games).

D) Please name the last three software purchases you made (shareware counts).

E) Please name your three most wanted software items (available OR unavailable).

Thank you for taking the time to answer this survey. If you have any other comments or suggestions, please do not hesitate to include them. I hope to be able to serve you in the best possible way. Please e-mail your responses to one of the addresses below.

> don't know if this has been asked before, but what would be involved in
> making a little black box that would allow you to plug a PC serial mouse
> into the ST mouseport?

This can already be easily done, with no hardware adapter needed.

A standard MicroSoft compatible serial mouse can be used in the regular
ST mousport, but it needs a software driver.

DMC Publishing, out of Toronto, sells such a driver, and it's my understanding
that a similar driver is available for ftp from atari archive sites.

A standard PC *bus mouse* can be used with no software drivers needed,
but some slight modifications to the wiring of the connector are needed.

There should be text files telling how to do this on the atari archive sites,
and I know we have them in the Atari Forum on CompuServe.

Stalker from Gribnif works well with 1.44 and is a VT-100
emulator. I don't know how well it will work with the 2.88 speeds, but
since my internet access still doesn't have them, it is not a problem.

The German shareware program "Connect"; without a doubt!!!
It might seem a little complicated at setting up at first, but once you've
gotten to learn the basics you'll never want to change- has some very advanced
features and is absolutely worth the price asked. You even get a printed
manual.

```
Hello folks,
I got a PD disk of Hack and very good it is too.
However I cannot seem to save a game. It says
'cannot open save file'. Can anyone help??
Or is there a better dungeon game to play??

Davy

3323. PORTFOLIO NEWS no 1

Newsgroup: comp.sys.atari.st
Date: 1995-05-23 00:00:00 UTC
From: Jan Sedlak <sedlakj@dec59.ruk.cuni.cz>
Message-ID: <3ps6f7$grg@dec59.ruk.cuni.cz>
Source record: 165070

```
**************************************
* *
* P O R T F O L I O N E W S *
* *
* Internet newsletter for *
* Atari Portfolio users and fans *
* *
**************************************
No 1 April 7, 1995

*******************************************
* Portfolio in the Czech Republic

There is a PF club that provides user services instead of Atari Corp.
or dealers who are dead in this country.

Contact:

Portfolio
252 45 posta ZVOLE
tel: +42 2 99 61 894

INTERNET:
sedlakj@pedf.cuni.cz

************************************
* What is new for Portfolio?

HARDWARE:

- PortWalk - tape recorder interface
Enables to save and load files onto any tape recorder cassettes. It is
very handy, and unlike 8-bit era of "tape recording", this interface
is very reliable thanks to error detecting code.

- 128 KB RAM CARD
Atari cards are very expansive - the RAM card we developed uses one
Low-Low Power chip and CR 2025 lithium battery (plus some diodes).
The assumed life expectancy of the battery at least 2 years.

- 25 pin parallel interface
As there are big problems with Atari dealers in Europe, we decided
to produce 25 pin Centronics (Parallel) Interface. It is a bit
smaller than original interface and consumes twice less energy.

- FolioDrive - 3,5" floppy disk unit with included parallel
interface and battery pack
It was specially developed for Portfolio and enables to read and write
```

1.44 MB PC diskettes. No cables more needed. You can run files directly
from the diskette.

SOFTWARE:

* In February we have finished a graphic version of Portfolio
BIOS and DOS.
This means that Portfolio can display any character using direct
access to the LCD driver. Thus Portfolio can be used in countries
with extended alphabet (e.g. in Czech Republic). We used similar
routines to those used in PGC and PGX format. The resident
program runs even under ROM applications.

* There is a PC program that enables to work with Portfolio .TXT
and .ADR files in the same way as on PF.

OTHERS:

* Genuine leather case with a battery pocket
Protects Portfolio against dust and other "evils". One built-in
pocket for identity card or passport, another pocket
for 3 AA batteries. Full handwork.

****
* Things under development:

- Upgrade your PF to 512 KB RAM!!
We are going to upgrade Portfolios to 512 KB of system RAM

- 60*10 character display
Another aim of ours is to make Portfolio display 60*8 characters using
8*4 pixel fonts. This will mean that user will see more of the whole
screen if running PC files.

We hope to implement other graphic features:
* blinking
* inversion
Portfolio thus will become more PC alike.

There were already some attempts to make soft running in 60*8 mode,
but the new driver will be working constantly with all files.

****
* What we want:

- We are looking for Portfolio users in POLAND, HUNGARY, RUSSIA.
We want to offer them the new BIOS with their characters.

- We are looking for any Portfolio activities in the world.

- We plan to develop following peripherals, provided there are
enough Portfolio users to be interested in them and to buy them:

* new version of FolioDrive 3.5 inch FDD unit
with parallel interface, battery pack

+ internal 128 KB memory chip to serve as CASH and B: disk.

* FAX-MODEM module to send and receive fax, modem messages every where
in the world

* cordless, radio-wave based interface to connect PF to PC

* 512 KB or 768 KB SRAM module to serve as a data storage medium

* Interface for PCMCIA cards

****
* What we are looking for:

- any PF fans that want to join us

- any PF users who are able to develop new soft

- information about: Re:Port, Portfolio Connection Newsletter, etc.

- any kind of emotional, mental and other support

- any dealer that is willing to go on with
PF stuff and wants to sell our products

****
* How to get the described things

We hope that TOAD COMPUTERS will distribute
all our products in the USA and Canada.

Please support our efforts in promoting Portfolio
and send them your request for PF and products

Their e-mail: toad@charm.net

Otherwise send e-mail to us:

sedlakj@pedf.cuni.cz

****
Special greetings to:

Don Messerli - for his soft and graphics
BJ Gleason - for PBASIC and tons of other things
S. Spoelstra - for his BASIC, and others
Tomas Dusek - Go on developing the hardware!
Martin & Milan Hrdlicka - the authors of new graphic BIOS

Source record: 165074

I just wanted to announce that the Atari Web pages now has a new section included. This section covers tips, cheats, and solutions for games on all Atari formats. Currently the cheats are split into Computer, Jaguar and Lynx catergories, but if I get any cheats for other Atari consoles, or for the 8 Bit Atari I may divide the sections further.

This is a new addition to my pages and is fairly empty. Over the next couple of weeks I've got several additions to make. If however you have any tips, cheats, or solutions for games on any Atari format please contact me with them and try to make it clear what system the cheats are for.

I hope you all enjoy this section and I look forward to your response. Bye!

3330. ST Emacs/Gemini problem

Newsgroup: comp.sys.atari.st
Date: 1995-05-23 00:00:00 UTC
From: gio@wcl-rs.bham.ac.uk
Message-ID: <3psl6a$jit@sun4.bham.ac.uk>
Source record: 165077

I'm having a problem creating the emacs.ttp executable.

I've unpacked the .zoo file, and set up the environment variables to point to the relevant locations, but when I run dumpemac.tos from the Mupfel shell I get the following:

```
> This is `dumpemac', the coffee break edition
> written by Frank Ridderbusch
>
> The dumping procedure takes about 13 minutes and 30 seconds
> on a normal ST. So, it's time to have a coffee break. You
> should be back at around 13:13 o'clock.
>
> First dump. Commandline: .\temacs -batch -l loadup.el dump
> Cannot open load file: loadup.el
>
> Couldn't rename first dump to xemacs.1!!!
```

I presumed that it failed because Mupfel doesn't recognise .\temacs as an executable program, so I renamed it to temacs.ttp to see if that worked. Unfortunately all I got was:

```
> This is `dumpemac', the coffee break edition
> written by Frank Ridderbusch
>
> Either `temacs' or `dumpfix.ttp' are missing in the current directory
```

Can anyone point me in the right direction? I guess it's a problem with my Mupfel setup, but I've no idea what might be missing/incorrect.

Thanks in advance.

Be seeing you...

I use vi. So `move to the beginning of the paragraph' just means
pressing the `{' key, and `}' moves me to the end. That wasn't too
much work.

>And won't LaTeX also reformat the paragraph, so the '>'s in the
>first column will probably end up elsewhere? :-)

Indeed. If I'd want this strange way of quoting in a real document, I
would of course have put it between \begin{brquote} and \end{brquote}.
The implementation of this brquote environment is left as an exercise
for the reader :-)

>--m "glad people have a *choice* between LaTeX and WSIWYG"

Oh I have the choice. I choose LaTeX. Even if I can use xwp or
framemaker here at uni. Most people have to *pay* for their
wordprocessor, and the price that's asked for most WYSIWYG-software
makes my choice even firmer.

Regards,

3333. I REALLY NEED SOME ADVICE HERE !!

Newsgroup: comp.sys.atari.st
Date: 1995-05-23 00:00:00 UTC
From: Y.J.J.Thal@kub.nl
Message-ID: <19950523154943.Y.J.J.Thal@sp0400.kub.nl>
Source record: 165080

hi there..

I'm in the position to buy an ATARI ST 520 + for the purpose
of midi-sequencing. Since I can buy it for almost
nothing, I'm curious if I can switch from sequencing on my PC
to the atari. (I'm now using cakewalk 3.0 + midi interface MQ
for my dj70 and jv880) This could geive me the advantage
of using my pc for harddisk recording using saw in the future.
(given my quick harddisk and 8 mb's in the 486 dx2)

The quewstion is : Should I buy the damn thing or not ?!

I heard it has a midi interface in it itself, but does it work properly ?
I know a lot about pc's but none about the atari.
eh, by the way, cubase is no problem.. I already have it..

So gimme some advice please and maybe I can do something for you.

It'll be my pleasure.

See Ya.

Y. (Y.J.J.Thal@kub.nl)

> development and support are important.

Atari Corp no longer produces computers of any kind, period.

As for long term prospects, you can draw your own conclusions.

C-Lab in Germany has licensed the Falcon030 from Atari and is currently manufacturing them, mainly for the music industry. It's likely that you would be able to replace your current machines if necessary, but the cost is an open question.

Development is now in the hands of dedicated third-parties. Except possibly in the music area, there is little monetary reward, so there's not likely to be much commercial activity.

Source record: 165082

> I think its safe to assume the headset exists and is fully working. I am
> sceptical however as to what (if any) VR software Atari will launch that is
> any good (rather than just crappy 3D graphics).

A Press Release from Virtuality seems to indicate that *they* are actively programming Jaguar games to be released with the VR headset, so we might get lucky and get some good games for it.

People who tried the system at the recent E3 show in the Los Angeles area were pretty impressed with it. Unfortunately the game being demonstrated was NOT running on a Jaguar, and the representatives there indicated that the actual Jaguar game would be "toned down" a little as far as the graphics.

Other things relating to the Jag VR system: The handheld controller with greater degrees of freedom (don't remember exactly what Laury Scott of Atari said it would have.. not sure if it was 6 DOF) will NOT be included with the base VR system, but will be an extra cost option. The helmet itself will provide 2 degrees of freedom.. pitch and yaw.

The helmet is also NOT a true stereoscopic display device.. that is, you will see the game as a flat picture, just like on a TV screen, not in "3D".

The immersion effects are still said to be good.

Retail price is expected to be US$299.

> I think he meant "CARRIER DETECT"...

Auto-answer mode wouldn't help if he meant carrier detect, as the comms
software would still not know the modem had made a connection.

Any _realistic_ long term prospects for the continued development and support of the Atari Falcon lie with 3rd party developers, NOT with Atari.

Atari Corporation is through with personal computers and is not expected to contract out a manufacturing run for any more units. What you see is what you got.

Atari users can expect many more years of productive use, however, due to the dedicated efforts of the few software developers and hardware designers remaining.

Does your hardware/software continue to meet your needs/desires? If so, enjoy it. If not, replace it. It really doesn't _matter_ what the rest of the world does.

Hey, this is all just IMHO, of course, so feel free to draw your own conclusions.

>Specific Support Company? [...]

Personally, I think it's a matter of abusing the privilege or not. The very occasional and SHORT post to let people know you are out there and how they may contact you for more information on your products and/or services is just fine and indeed, a potentially valuable service to newsgroup readers. Let folks know how to get more info but don't ram it down everyone's throat.

Multiple posts of your entire catalog or frequent business solicitations is likely NOT to be appreciated, especially by those who PAY for their net access.

Announce your presence and the occasional 'special' or whatever, but don't rely on the net as your primary advertising venue as that strategy will backfire.

Try magazine advertising (there's a new one out now, ya know?), direct mail campaigns to users and clubs, and develop a good relationsip with dealers and distributors. It's easier now since there aren't that many left. ;-) Or rent space on a www server for your own web home page and advertise away!

IMHO, of course. :)

Apple's ResEdit (and commercial equivalents such as The Resourcerer) are similar in name only to resource editors (or resource construction kits) for the Atari.

Atari RCS tools allow you to graphically design menus, alerts, dialogs, etc for use in a GEM application but not much else. ResEdit allows you to do this and a LOT more and gives the average user many more ways to destroy a functioning program. ;-) It's not a 'better' tool, just a different one because of the vastly different software system architecture of the Mac.

While PhotoChrome 4 is a pretty good picture viewer it uses
Nope. Thatsa' nthe spoflt series, and the number of colours are
the same.
To get spc/spu you need jpeg4a.zip (jpg to gif), and dmjgif which
converts gifs (albeit years!) to 512 cols 320*200.
There are many gif viewers around, gifttp, quickgif,but for quality
viewing I recommend spoflt38 (need to register) for general purpose viewing.
Not only does it have jpg decompression, and a host of image enhancers,
transformation tricks!

-Al, udem148@bay.cc.kcl.ac.uk-

colour switching, like say the spoflt series.

Hi there,

How many people are using the OASIS package with service providers other
than Demon, also where are you (country).

If anybody is using OASIS with any other package than NOS please let me
know what you are using and how.

Thanks in advance.

```
R > Someone recently offered me an SM125. I believe it is
R > monochrome, but is it better than the SM124? Also he offered
R > it to me for 75 (ukp) this sounds a bit expensive!!

the SM125 was only made for one year, between runs of the SM125.
Among the differences - volume, on-off switch, and contrast controls
are mounted UNDER the screen in the front, and controls for
adjusting the screen's size and position are located on the back of
the unit, thus not requiring opening up the unit to make
adjustments. There's also an adjustable stand on the bottom of it.

I know, because I've got one of these sitting on my desk :)

You can run the Epson GT8000 & 9000 colour scanners with Digital
Arts' GTLook2 software running on a Falcon. Both have SCSI
options.

In the UK, these scanners and software are available from System
Solutions or CGS. I don't know about other Countries.

>Jim, sure its possible. However, it will take some surgery. The
>NOS/Oasis package was written specifically for the Demon system. Its
>installation etc. are only for it. However, as with NOS, I have been

Yes, it is, no it won't, no it wasn't, no it isn't, in turn.

Let's get a few things straight. Both NOS and Oasis are packages designed
to access the Internet over an open connection. The core of both suites is
KA9Q, a module which does all the hard work. All the rest is to get
information into and out of KA9Q, and this is what gets the data to and
from the net.

The major parts of the setup don't give a damn who you talk to so long as
they are told how to do it properly. For this there are script which can be
happily modified, rewritten and customised in any way you like to achieve
what you want. The whole system is totally configurable for a fixed address
SLIP or PPP setup (dynamic addresses can be dealt with, but it's difficult)

If you want some serious help with SLIP and PPP protocols, then I'm not the
right guy to ask; neither am I an expert in setting up NOS or Oasis.
However I have collated a lot of necessary data through having terrible

problems in setting my system up. E-mail me if you think I can assist.

3355. Re: how big a hard drive 4 ST?

In message <3plqnq$2vo@solaria.mil.wi.us>, dzander@solaria.sol.net said:

> Is there any kind of limit on the size of a hard drive for an AtariST?

It depends on the hard driver program you use. A few hundred Mbs is no problem. A couple of Gbs might be.

> what a "partition" is and what "hard drive utilities" I may need would

Drives are normally split into partitions to make better use of them. Each partition gets assigned a drive letter and appears as an entirely seperate drive. So if you had a 200Mb drive you might split it into a 100Mb partition and two 50Mb ones. So the drives you would have:

C: 100Mb
D: 50Mb
E: 50Mb

Hard drive utilities refer to the software the ST needs to have loaded to access a hard drive. It generally also includes programs to partition and format the drive.

> be appreciated. I'd like to really get a large (540MB-730MB) hard

Shouldn't really be a problem - though you should partition a drive of this size into at least 3 partitions. One large partition is very inefficient in terms of storage.

:-)

Roland.

RG>> port "incoming call" wire is inactive.
TM> Huh? I use Semper on my Falcon just fine without AA enabled.
Of course, I meant "Carrier Detect". It was very late at night when I came up
with that "incoming call".
I have in fact tested this problem with various callers using different
machines (PC, Mac), and I can confirm that my Falcon does not seem to want to
recognize incoming calls on its own. The *modem* does
(when AA is disabled), but the Falcon (running ConNect) does not pick up on the
signal.
Perhaps there is a problem with some of the AUTO, CPX, and ACC files running on
my system...

>BTW - not one word in the report about Atari computers, of course.

Sorry, man, you missed the profit train. The profit train pulled into
the station when Atari stock was at $ 1/2, then went up to $ 7. That's
called 1400% profit. Too bad I don't have a time machine.

Hello out there. I own 2 Sts, a 520STFM nd a 1040 STE and I recently bought a 2nd hand 2400 Fax/Modem. I have the splitter cable consisting of a 9-pin and a 25 pin connector which fits into my Rs-232 socket. However, it will not run. I do not know how to run the VT-52 Emulator <it just sits there>, and i have a copy of the ST Format BBS setup and it won't run on that either. Could there be a problem with the HAYES standard because the software is sending these wierd init strings that I can only decipher as being custom strings for that software.

If anybody could help me, I would also like some pointers on other software to use. I am looking at Vanterm. Is this adequate. And anyone within Australia could you please answer this question for me......

Who is the better server for Internet access: Ozemail or Compuserve Pacific?

Darned if anyone can answer that that I know!

Insomnia is gaining and I cannot steer it's path. I am extremely frustrated.

Please help me.

Hello,

>Connect is shareware, and disables itself after 30days.

Just for information: This is a bit outdated. Connect is fully usable for 30 hours of runtime, not 30 days, and it does not disable itself completely, but the following functions:

save options
save setup
learn script
automatic fee display

Cheers,
Philipp

I think *you're* confused - MagicMac is an operating system, not an emulator.
Anything that hits the hardware direct will most certainly not run because Macs
don't have that same hardware onboard.

Hmmm, I guess it _was_ misunderstood. Sorry, I get rather touchy when
it comes to LaTeX and stuff. It deeple depresses me that *so* many
people don't give a sh*t about typography. I'm getting tired of
having to explain over and over again that the typographical quality
of a document is *not* measured by its aesthetical appearance.

Let's bury the hatchet...

Try this address, it's where the Linux packages are developed for all
platforms. Which means you get it straight from the source!

FTP to -> tsx-11.mit.edu

You must read the small online doc files. They will lead you to the
Atari specific files. Everything is there, Atari, Amiga, Mac, PC, etc.

I hope this helps.

Rich

3386. Atari Works Black Page Syndrome

Newsgroup: comp.sys.atari.st
Date: 1995-05-24 00:00:00 UTC
From: jacquesa@cs.man.ac.uk
Message-ID: <3pva3r$4s4@m1.cs.man.ac.uk>
Source record: 164969

Hi, A little while ago, someone asked what caused the BPS, and they were told that it was a combination of a certain version of Works and low memomry.

However, I dont think this is the case, as yesterday, when I tried to print a 10 line letter from Works it tried to print a black page (I stoped it...)

I was using Works 1.271 (or something), on a 4mb Falcon, with no accessories, and only SPDGDOS.PRG, and FPATCH2.PRG in the auto folder. I was even running in 460x240x2 mode.

Thus, memory cannot be a factor, as I had just about the maximum ammount of memory possible on a 4mb machine... In the past, I have had it working with 800x600x16, a module playing in the background and 5 DA's, without problems.

So.... Does anyone know how to actually avoid the problem?

Cheers

Anthony

From: msh@mserv1.dl.ac.uk
Message-ID: <3pvdit$nu0@mserv1.dl.ac.uk>
Source record: 164972

Further to the Oric-1 is worth getting because it has a larger user base
than the Falcon I dug up the specifications of both machines:

The Oric-1

Specifications

6502 processor running at 1MHz
16k or 48k RAM
3 channel sound with noise
40x25 character display
240x200 pixel graphics display
Calculator keyboard (with click sound effect)
8-bit parallel printer port
34-pin expansion port
Casette recorder interface (7-pin DIN)
RBG output (5-pin DIN)
VHF/UHF television output

Comments
Released: 1983
Production stopped: ? (anyone know?)
Later re-released as the Oric Atmos, with a real (if somewhat small)
typewriter keyboard and an upgraded ROM.

Thanks to Bjvrn Lindgren for the information.

****

Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other
coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking

Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.

Bigger user base or not the Oric isn't even worth thinking about. No proper keyboard, not enough memory and too low a resolution to do anything decent. No body bought it really in the UK as the software support was almost zero when compared to the ZX Spectrum. It just faded away and no one missed it.

So why now mention it as comparable to the Falcon. It never was and never will be. The End!

: I've tested Turbo Pascal and Turbo C with PC-Ditto... No prob.
: The typical C compiler setup would probably be almost useless, though...

Try using C or Pascal compilers for the Atari....

GCC works well - you will have to get an early version if you only
have 1MB. GCC is PD and VERY good.

On the other hand, if you have no hard disk you will have more luck
with Prospero C (was on coverdisk) or Sozobon - neither of which I
have used since getting my hard disk :-)

There are a few PD Pascal compilers out there - I have never tried
them, though.

Beric..

Uh, are we playing the same game here?
Elite II is one of those far too few (are there any other?) games were
it's all up to you to make it interesting.

*** Don't follow the 'tips' from the magazines! ***

I can't believe anyone would want to go back and forth between Sol and
Barnard Star to build up money without getting hurt.
Don't use the 'tricks' to get more money.
Don't use the 'wormholes' (read 16 bit overflow) unless you want to
go and explore deep space.
Kill your enemies/victims fairly.

I went hunting pirates almost from day one, which I think was quite fun.
It's been quite a while since I played now, but I was at the third highest
'macho' rating, coming close to the second highest (hundreds of kills).
(IIRC the order is Elite - Deadly - Dangerous - ...)

At the end I was trying hard to get the military to trust me again, since
I realized that I was only on the second _lowest_ level in both blocks.
All the most interesting missions seems to need much higher rank, but I
was careless and worked for both sides....

Assassinations can be interesting, especially if you have a completely
clean criminal record to maintain. ;-)

Trading is more or less necessary to keep afloat in Elite II, and sooner
or later you're going to wind up with enough money not to have to care
about loosing some when you change ships. The huge ships are good for
trading, but you really need a smaller and faster one if you want to fly
some missions or assassinations.

If you think it's too easy to kill the other ships, just downgrade a
couple of steps and go shoot on a space station. A dozen or so police
ships should give you something to do. ;-)

Learning to fly well enough to do some mining or just land without using the autopilot is something I plan for the summer.

I'm sure there are other people with other ideas on how to make Elite II a fun game. These were just my personal thoughts.

The game supports expansions. David Braben, who wrote Elite II (and now co wrote Elite III on the PC with 10 other people who form Frontier Developments Group) said that Frontier Developments were, so I understood, going to release an expansion for Frontier. Elite III: First Encounters looks good, though, although it would have been nice to have an expansion for the original Elite II. I have heard of an expansion being available on a buletin board, but I haven't been able to find any. I think its more likely to be in Amiga or PC file areas, since the file format is probably identical. The one I herad of has a much larger top of the range ship. My favourite is the ASP MkIII, though, Since the ships get ridiculously big and won't run on a military drive.

3393. For sale: Spectre package w/Quark XPress and others

Newsgroup: comp.sys.atari.st

Hello! I have a package deal for Spectre GCR including cartridge, 3.0 disks, cables, manuals, registration card, packaging and several informative GBS newsletters. Mac System disks are included too. The following are *INCLUDED* with the deal and all are complete with instructions and disks.

Quark XPress 2.1
WriteNow 3.0
Aldus Freehand 1.0
Solitaire
Rental Center Helper
Intermail
BackMatic 2.0 (Macuser 5 mice rating) backs up unattended
ImageStudio demo (with sys/fndr 4.1/5.5)
A4 Accounding demo 4 disks and manual
Also, several disks of assorted utilities and misc indespensable software
Take all of the above *including the commercial software* for $200
Add a 40 MB SCSI tape backup incl 7 tapes for $75

> manufacturing them, mainly for the music industry. It's likely that you
> would be able to replace your current machines if necessary, but the cost
> is an open question.

According to Vic Lennard's ``Atari Notes'' column in the May issue of Sound On Sound, C-Lab's licence to produce and develop Falcons ``imposes certain restrictions on the release of a budget machine whilst Atari still has stocks of the current computer.'' Currently, Digital Awareness, the UK distributors, are advertising the Falcon Mk II in the music press at UKP1999 ex. VAT. Equivalent(-ish) Mac systems would include a 7100/80 w/16MB and Audiomedia (UKP3450) or a 7100/80 w/16MB and Session8 (UKP4995, both ex. VAT)

Interestingly, in Digital Village's chart of top 10 best-sellers by value, the Falcon Mk II has done over 20K of business and comes in 5th, just behind the SY85 and BassStation Rack, and ahead of such hardy perennials as the S3K series. In the hard disk recording chart, the top 5 places are as follows:

1. ProTools III
2. Falcon Mk. II (C-Lab)
3. Session 8
4. Yamaha CBX-D5
5. Falcon (Atari)

Since a ProTools + Mac setup won't leave you much change from 8K, it's not suprising that it tops the list; a CBX-D5 is about UKP1500.

So yes, the Falcon IMO will survive for a few years at least; apparently it's making inroads into the music marketplace and when Atari's stocks run out, might we see a true budget machine?

Well I don't appreciate the thinly veiled flame there.

I have tried both. All of our documentation is now done in FrameMaker, and after converting over my thesis, I can't believe how much simpler it was.

Like you, I ignore everything but the text. I just type, add in my formulas, ask it for a TOC and out it goes. What version were you using on what platform?

My point wasn't *quite* that. The point was that if good GUI based systems were available from the start - and they were not - I don't think TeX would have ever been seen.

You see, there's other benefits you get from an OS that "just supports it". For example, when I install a font in my Mac (or PC or Atari), ALL the programs use it. Period. The same is certainly NOT true for TeX (who's font handling gives me the shakes).

This means that when it's time to move from the 3 page colour eye-catcher, to Frame's formulas to Word's 2 page letter, everything is the same. And add to that the attempts to make a standard interface, and the time I spend learning one helps me learn the others too - again, something you don't get in a language like TeX.

> I'm beginning to think you *did* mean this. To quote a bit from the
> `Why LaTeX'-part of the LaTeX-documentation: `Documents are to be
> read, not hung in museums'. A folder is meant to catch the eye, but I
> get a headache from having to read that style in a *real* book.

And again the claim that a system that's easy to use makes bad output. No.

> Hmmm. I can work with LaTeX fine. I don't need a GUI for that. But

> spend their time producing awful documents --- and don't even know it.

Yes, but these people at least now have a voice. Just because you don't agree with what someone says doesn't mean he should not be heard, we call this Freedom of Speach. Well I feel that just because someone doesn't understand everything there is to know about printing and typography doesn't mean they should not be allowed to produce documents. This is what the simple programs have done for the world.

> _If_ you already know what makes a document readable and
> typographically correct. Most people don't.

Yes, but learning THIS is MUCH easier than learning a language. I can go out and buy huge numbers of books with design tips and such that tell me in an hour about this stuff. The Mac is Not a Typerwriter is a perfect example, you can flip though that in an hour and understand it all. Try the same with a TeX manual?

> Note: I just made the above paragraph boldface. It wasn't so hard.
> I just typed {\bf before it, and } after it. I bet that's even faster
> than selecting the block with your mouse (thus leaving the keyboard)
> and selecting the `font' menu, the `change appearance' menu, the

Actually, test after test shows this not to be true. I won't get into it though, I didn't do the tests.

For C you can use standard ANSI packages, they are the same on all
platforms (ehrm, almost..), for Pascal I suppose you mean the "turbo"
flavour? or ISO? AFAIK PurePascal follows the Borland turbo tradition, which
is close enough to ISO to be enjoyable. HiSoft was distributing a turbo
like package as well, can't recall the name.

>paddle lines. That is, what size potentiometer do I need to cover the
>full 0-255 range?

A 10 k pot. would probalbly do, but for safety use a 100 k instead. Both should give the full range, but the 100 k will draw less current and so will probably be more reliable.

Also lookout for a high quality pot., the cheap ones are not really designed for a lot of use and would soon develop faulty tracks especially as each end of their full movement.

Source record: 164992

I have a 1040 ST with 4Mb of RAM and a HD with sufficient free space.
I have been running the standard GEM desktop for a long time and am
now tired of single-tasking, i.e. finding something else to do while
I download, etc.

I have heard of a number of possible multitasking solutions: MultiTOS,
Geneva, etc. I would like more details about these before I do
anything. Some of the things I am interested in are:

- how stable is it?
- does it still support GEM/TOS or will it allow booting to
either GEM or it?
There are a number of programs I would like to continue
using.

Lastly for anything that is not PD/Shareware could you tell me the
manufacture/distributor if you know. There are no Atari suppliers
in Calgary.

What about ZX Spectrum? I have one Spectrum+ and a 100 Games and
a speech synth in my cellar, but it has burned some keyboard
connectors. Can I still get some spare parts for it? Maybe I'll
drop the Falcon and start doing some real computing with it.
It has the BEEP command, doesn't it?!

THE KEY TO ORGANIZING YOUR HEALTH RECORDS

"If you care about yourself and your children, you will do everything you can to know your family's medical history. It can save your life, and the lives of those who are dear to you." -- Dr. Aubry Milunsky, Director, Boston University's Center for Human Genetics (Life Magazine, March, 1995).

Your Lifetime Health Planner offers the simplest, most effective way to take charge of your health. Enter important facts about your health history, keep a record of the names of medications and their effects, document each doctor visit and diagnosis. You will have the information you need, and in the event of an emergency, so will your family.

Your Lifetime Health Planner, 198 pages in a compact, loose-leaf binder, contains a variety of sections which include "Doctor Visits," "Medications," "Family Health History," and "Doctors and Specialists." The Planner is a must for the busy executive who needs to stay organized, for seniors who are receiving care and for newborns who need a record of their health care.

Parents Magazine recommended the Planner to its readers (April, 1994) and MCI called it "a useful resource in managing your personal health records." Margie Smotherman, Coordinator, Employee Health and Wellness, Blue Shield/Blue Cross of Iowa, said: "The employees felt that these (Planners) were great tools to not only record their pertinent numbers, but to plan for doctor's visits."

To get your copy, send a check or money order for $19.95 (plus shipping and handling) to :

Your Lifetime Health Planner

] : aside from the emulation, I don't like the program that much. Are there
] : any others out there that I could download/ftp?
]
] The German shareware program "Connect"; without a doubt!!!
```

As long as you have NVDI and preferably a mono' monitor as well. (Although, I've found a GDOS font that works perfectly well in medium resolution!). But using anything about 2400 baud with a GEM-window based comms program, without NVDI or some other screen accelerator is quite unpleasant! :)

STorm seems to crash quite a lot, so I gave up on that. STalker from what I've seen is brilliant, but on this setup at least (for reasons neither I nor Dan Wilga can think of) crashes a lot (I think my machine has a defective blitter or DMA chip or something). As long as you don't need heaps of features, Uniterm is well worth a look, it's stable, quick, and has arguably the best VT100 emulation of any program on the ST.

FZDSterm has heaps of features and is IMHO simple to use, but forget about trying to use it for VT-100/VT-102, it can't cope.

Connect, Uniterm or STalker would be your best bets. Connect is shareware, and disables itself after 30days. Uniterm is (IIRC) PD, and fully operational and STalker is commercial although there's demos of it on most major Atari FTP sites!

Best places to look

atari.archive.umich.edu in atari/Telecomm/
(ftp://atari.archive.umich.edu/atari/Telecomm using WWW/Lynx)

If it's not there, you'll be ahrd put to find it elsewhere :)

The game does indeed live up to your expectaions, albeit using a small
dongle, only 150 pounds. BTW what is a 'Falcon'? I've heard about it
but never actually seen one on the shops, is it an Atari or a Commodore?
Is it better then the Oric 1, how much does it cost?

>colours, texture mapped graphics and 16bit, 16 channel stereo sound!!

The Oric is little more than a ZX Spectrum and as a competitor at the time it failed miserably, I doubt the user base is anywhere near as large as you think with most Orics either being dead, sold off, or gathering dust. I beleive it also has 48K of RAM and loads from tape like the Spectrum. Enjoy this machine it had nothing going for it when it came out and it has less now.

As for Doom, I won't even comment on this, it is just getting silly.

Can't help you on that. Sorry.

>Or is there a better dungeon game to play??

If you can get resolutions of 640x400 or above on your machine, try getting
hold of NetHack - the original Hack game GEM'ed up with proper graphics
instead of characters and so on :)

I've never been a Hack fan myself, but some of my freinds back home are, and
they were very impressed :)

I think it works in High res on an ST (though don't quote me on that), but it's
really intended for TT or Falcon resolutions...

Message-ID: <3pu91r$ok@golem.wcc.govt.nz>
Source record: 165044

] I just downloaded the English version of Tcache from GEnie and am pretty
] impressed with the docs. I was wondering if anyone would like to share the
] own experiences with it? How do you like it? Any drawbacks? How does it
] compare with ICD's cache (if you know)? Anything at all you can share.

Is this full english version on an FTP site somewhere? And, unlike
previous versions I've seen, do the setup menus etc. work in medium res'?
(The last one I saw had every 2nd button overlapping etc.)

Apparently, it's supposed to be more efficient than ICD's one, what I want
is a program that caches Directory+FAT seperately to data, or even better,
one that scans the drive and gives information on optimum cache/buffer
sizes etc.

Source record: 165045

] Atari RCS tools allow you to graphically design menus, alerts, dialogs, etc
] use in a GEM application but not much else. ResEdit allows you to do this a
] LOT more and gives the average user many more ways to destroy a functioning
] program. ;-) It's not a 'better' tool, just a different one because of the
] vastly different software system architecture of the Mac.

I was none-too impressed with the old RCS program, the PD/SW "ORCS" (Ottos Resource Construction Set) IMHO is quite a bit better with more features etc. If you want to fully support TOS/GEM v4.xx and above, then you basically need "Interface" which Gribnif distributes, as it handles all the 3D, and many-coloured interfaces properly.

ORCS is available on atari.archive.umich.edu - I use it quite often for translating German programs into English. (Even if it's not necessary, I just like what I'm using to be in my 1st language :)

3436. Anyone use PC emulators?

Newsgroup: comp.sys.atari.st
Date: 1995-05-24 00:00:00 UTC
From: abstract@wam.umd.edu
Message-ID: <3pubvb$agh@cville-srv.wam.umd.edu>
Source record: 165047

All I really need a PC emulator for is to run Pascal/C compilers for classes... I would be doing this on 1040STfm... Any suggestions as to what would be the best one to use? "PC-Ditto" seems to be the cheapest... would this work for me? Thanks in advance!

Source record: 165048

I have used an SM125 monitor for over 8 years, and
am very pleased with it . It provides a larger screen
area than the SM124. It is worth at least 50% more than
an SM124, IMHO. $75 (Us, I presume, is a bit high, but the
better resolution is probably worth it.

I've tested Turbo Pascal and Turbo C with PC-Ditto... No prob.
The typical C compiler setup would probably be almost useless, though...

3440. no!desk queries.

CHRS: IBMPC 2
Anyone know if you can get No!Desk to allow more icons on the desktop.
Seems like I've hit the limit, but I need more!

Also selecting multiple files and then moving them seems a little 'iffy',
as sometimes the mouse tries to rubber band instead of grabbing the icons.

Again when selecting multiple files it'd be nice to be able to do a
multiple rename, something that No seems not to like.

Source record: 164857

To: dzander@solaria.sol.net

From: tom_thomason@fpc.ct.se

On 21 May 95, Douglas Zander shot this through the ether to All ...

DZ> Is there any kind of limit on the size of a hard drive for an
DZ> AtariST? I never owned nor worked with hard drives before so any
DZ> explanation of what a "partition" is and what "hard drive utilities"
DZ> I may need would be appreciated. I'd like to really get a large
DZ> (540MB-730MB) hard drive and fill it up with games, programs I write,
DZ> and other stuff. Any help would be appreciated. Thanks.

I have customers using hard drives amounting to several Gb of storage
space so the drives you mention above shouldn't present any problems. I'm using
a 540 Mb drive myself and my partner has an 830Mb drive.

If you look at a hard drive as being equivalent to a filing cabinet
then the partitions are the equivalent of the drawers in the cabinet.

Hard drive utilities are software collections that enable you to boot
from and maintain your hard disk.

Anything else?

BFN,
Tom

D> Atari market (what's left...). I would think people would be happy to
D> see me around.
D>
D> P.S. If other people feel I should just give up and not post to
D> this newsgroup, tell me.

Whoa! you don't have to overreact here, Don. I hardly think Ofir was just telling you to shove off. He was just trying to maintain a sense of order in here. I must admit that I'm not aware of the Atari specific commercial advertising areas on the InterNet but I'm sure they must exist. There are, at least, such areas on both FIDO and NeST. I think Ofir was just trying to point out that there are such specific areas (although, I must admit, he might have done better if he'd supplied the area names!)

As for your final comments, I'm sure that people ARE happy to see you around and certainly don't want you to give up trying. Witness the fact that I (and, I'm sure, others) did reply to your questionnaire. I understand how you feel. Being an Atari distributor and retailer myself, I often ask myself "Why bother?" when confronted with different situations. Then I remember how much I like the machine and the majority of the user base. Keep on truckin'.

All the best,
Tom

WA> 232 socket. However, it will not run.

Did this same cable work with the modem before on the vendor's set-up?
RS232 is funny! RS232 printer cables are not the same as RS232 modem cables
and bothe are different from RS232 null modem cables! Use a cable which you
KNOW works or be prepared to fiddle around with the cable-pin assignments.

WA>I do not know how to run the VT-
WA> 52 Emulator <it just sits there>,

Well, that's it's job, after all - to sit there until you pass a command
through it. Have you sent commands to the modem like ATZ (initialise), ATE1
(echo my commands), AT&V (tell me what your settings are)? Have you even
got a list of Hayes commands?

WA> and i have a copy of the ST Format
WA> BBS setup and it won't run on that either.

Not surprised, if it is a BBS it will require an awful lot of setting up.

WA> Could there be a problem with the HAYES standard because the software
WA> is sending these wierd init strings that I can only decipher as being
WA> custom strings for that software.

If software sends anything without being asked it will be to the Hayes
standard.
WA>
WA> If anybody could help me, I would also like some pointers on other
WA> software to use. I am looking at Vanterm. Is this adequate.

Yes, a fine program. I use it a lot.

3452. Towers II/Falcon030 Help?

Newsgroup: comp.sys.atari.st
Date: 1995-05-25 00:00:00 UTC
From: jperez@uhunix3.uhcc.Hawaii.Edu
Message-ID: <D94tBw.3s0@news.hawaii.edu>
Source record: 164863
Cross-posted to: rec.games.video.atari,comp.sys.atari.st

For those of you who may not be familiar, Towers II is an Dungeon Master style RPG for the Atari Falcon (by JV Enterprises) which features full motion, full screen, true color, true stereo, and much more. It is a tryware game available from many FTP sites, with the manual (and passwords) available for about $25.00. In my opinion, it is a superb game, with a comfortable mixture of puzzles and combat. Lots of monsters, spells, magical items, and about 13 levels comprise the game. If you own a Falcon, and enjoyed Dungeon Master - you owe it to yourself to give this one a try. The $25 fee for the manual is really insignificant, especially considering the wuality of this product.

Currently, I have nearly completed level 4 (the Elemental Plane) and am completely stuck. Although I have nine keys, there are still two doors that I cannot open (one in the water plane, and the marble door in game, with a comfortable mixture of puzzles and combat. Lots of monsters, spells, magical items, and about 13 levels comprise the game. If you own a Falcon, and enjoyed Dungeon Master - you owe it to yourself to give this one a try. The $25 fee for the manual is really insignificant, especially considering the wuality of this product.

Currently, I have nearly completed level 4 (the Elemental Plane) and am completely stuck. Although I have nine keys, there are still two doors that I cannot open (one in the water plane, and the marble door in the library). The mace of elements is fully charged, nearly everything in the Tower is dead (due to boredom ;) and I don't know where to go from here. If there is anyone else playing this game here in this newsgroup, I would greatly appreciate an e-mail response.

Try STarCall, vt 52,100,200,220 & ANSI... built in editor & buffer.. can use
'full' screen (as per flash 1.6) or terminal window.. It's fully
functional shareware with 10 second shareware fee reminder dialog....
ver 2.0E is now available which is in ENGLISH.. a few problems on TT's but
is great on ST's..

Ver 1.8G is available on some FPT (I think ftp.cnam.fr or ftp.uni-kl.de)sites
& ver 2.0E from a BBS in Germany Phone GERMANY 02363 2610

Try it you'll love it

You could also try the excellent shareware Teddyterm, AFAIK it runs VT and
ANSI modes. Colour or mono; Colour display is same as the mono except for a
few coloured dialogs and things, tho it will display colour input. Simple
and effective.
It used to be on ftp.demon.co.uk in pub/atari/comms, I think.

Sorry, my new server has "more included than new" syndrome - it's a bloody
nuisance.

3461. What is comp.sys.atari.announce ???

Newsgroup: comp.sys.atari.st
Date: 1995-05-25 00:00:00 UTC
From: sedlakj@dec59.ruk.cuni.cz
Message-ID: <3q1ivr$3ki@dec59.ruk.cuni.cz>
Source record: 164922

A question:
I found a news group COMP.SYS.ATARI.ANNOUNCE.
But it seems to be empty or somehow blocked.
I tried to post a message there, but nothing happened.

Do you know more about this news group?

Thanks

Jan Sedlak

sedlakj@dec59.ruk.cuni.cz

I actually built a MIDI interface for the Jupiter & was using it with a Roland Juno 106 & a Yahama Dx7. I was going to write a sequencer & patch librarian.

Then I heard about the ST, got one and it was bye bye Jupiter Ace MIDI.

One thing about the ACE,the user manual was excellent (for the time).

It is a moderated group for announcements. When posting to it, it can
take a couple of days to appear, because each posting is checked
before it is allowed out into the big bad world.

Well, I don't recall too many firms advertising software for NON-Atari machines in the old STart magazine periodicals from Antic Publishing, do you?

Then again, do you recall the magazine itself?

Ah, those were the good 'ol days. :)

Yeh, but it's a BIGGER nuisance to us!

To avoid the "more included than new" error messages (inititated as an attempt to cut down on "me too" replies and other wastes of bandwidth), all it takes is a little effort on your part to delete the less relevant parts of the message you are replying to. It's not that difficult.

Most, if not all, of the *.announce newsgroups are _moderated_ newsgroups
which means they are closed to postings from anyone except the moderator;
an individual who has taken the responsibility to post newsworthy events
and, well, 'announcements' about the subject.

The moderator is for that group is Yat Siu (email Lexicor@world.std.com)
who must approve all messages first before allowing them to be posted.

He just posted a message #120 entitled 'Comp.sys.atari.announce guidelines'
so I suggest you go back and read that first.

3470. HS modem problems

Newsgroup: comp.sys.atari.st
Date: 1995-05-25 00:00:00 UTC
From: Auburn Placer County - Tahoe City <libaubt1@nic.cerf.net>
Message-ID: <Pine.SUN.3.91.950525111455.9641B-100000@nic.cerf.net>
Source record: 164931

Hi All,

First, I have a Falcon. I have several serial-fix patches: fpatch, bmapfix, scc, drvin, and mfp_falc. You'd _think_ these would fix all of the serial port bugs, and even fix some that don't exist :)

I can't get transfer rates over 1,600 CPS on my 28.8, which is just plain strange. I should get 3,600 throughput, since the port is set for 38.4, even without compression. WITH compression, my transfer rate should be even higher. And yes, I connect at 38.4, so I believe the problem is on my end. Of course, maybe the problem is that the remote modem doesn't support v.FC/v.FAST? My modem doesn't have v.34 :(

Another problem, I can't set the port over 38.4. If I set it higher, I get no response from the serial port. When using MiNT, I use the standard U:\dev\AUX device, and when not, I use modem2 (which is correct). So, what gives? I'm tired of my 28.8 performing like a 14.4

Thanks for any help :) BTW, I'm using CoNnect.

3471. UltraScript help

Newsgroup: comp.sys.atari.st
Date: 1995-05-25 00:00:00 UTC
From: steve@damp.apana.org.au
Message-ID: <3q222m$j4n@frisbee.damp.apana.org.au>
Source record: 164932

I'm using UltraScript which was bundled with Passport Design's ENCORE scoring program.

But not successfully....it use to work.

I can print a postscript file from ENCORE, but can't print the ps file with UltraScript.

It loads properly, tells me that it has initialized and is print my ps file....

Then it seems to hang up while trying to access Drive A.

Sometimes I get an error msg 'Can't Read Disk'.

Using a Mega4 STe, G+Plus for GDOS (seems to work OK for STraight Fax) UltraScript accesses the Ufonts and other fonts OK.

Any suggestions?

Thanks. Steve steve@damp.apana.org.au

Try Freeze Dried Terminal or TTerm. Both are good progs although
niether are supported any longer there is not much that needs doing to
them. I know TTerm is on Hensa probably Freeze Dried is as well.

These magazines are free, but shipping must be paid by the receiver.

I have a complete set of ST-Log and all of the Analog magazines back to issue #9 or so. I also have a fair number of Antics (mostly early stuff from '82-'85, or so). There are also some Atari Explorer, Antic's ST magazine (whose name escapes me), and a few European ST magazines.

Let me know if you are interested and I can compile a list.

If you are in the Milwaukee area, you can pick them up for free.

Sorry to contradict you, Rich, but the stuff on tsx-11 has been
compiled by an Amiga developer. It is rarely, if ever, current
with the latest Atari patches. I've had nothing but trouble trying
to use the stuff there.

The site "ftp.uni-erlangen.de" is where Roman Hodek keeps his latest
kernels and patches. In case you don't recognize that name, he is
the coordinator for Atari Linux. The patches he sends to Hamish
Macdonald *eventually* find there way onto tsx-11, but there is
often significant lag time.

I have the following Atari Computer for Sale:

Hardware:

Atari Mega STE 4
4 MB RAM
50 MB internal hard drive
Magnavox ICM135 14" Stereo Color Monitor
External DS(720K) Floppy Drive
Supra 2400 Baud external Modem
Beetle Mouse
Atari standard Mouse
Wico Joystick
3 2600 Joysticks

Software:

Pagestream
WordWriter
Word Flair II with FSM GDOS
Diamond Back II
various other utilities (Warp 9, look it, etc...)
plus MANY GAMES (Dungeon Master, Empire, Uninvited, etc...)

****
Everything is in MINT condition, and I have the original
manuals for the software/hardware, as well as the orginial
boxes for the hardware.

Shipping can be arranged. I would prefer US sales, payment
must be in US funds.

I am asking $600 or best offer for the whole package. Please
send me EMAIL at dogman@svpal.org if interested of if you have
an offer.

David,

it depends entirely from who and where you purchase it from too. Support your dealer, but that price is way too high.

Cheers

Cubase runs just fine in Atari's (it was made for it in the first
place!), and the Midi IN/OUT works.

BUT: Cubase needs *at least* 1040Kb (1Mb) of RAM to work at all.

Cubase Lite works on 520Kb, but it's quite limited, and there are
no sync options in it. Also, Cubase needs a b/w monitor (SM-series)
when you run it in ST/Ste, and if you want to sync it to SAW, you'll
need a MIDI expander, which has SMPTE sync connectors, and you
also need a similar card for your PC (I recall there is only one
card that can run the sync for SAW ... MPU-something).

So I'd say don't buy it, unless it has 1Mb of RAM, and you can
find a second hand Midex+, SMP-II or Unitor (Midi expanders)
for the sync (you'll get also more Midi in/out's with those
expanders).

BTW: check also that the Operating System is v.1.2 or 1.4 (in
ROM - no from disk!).

I just seen the following ... Oric-1000 for sale....
RAM : up to 16Meg
CPU : up to P5 at 100MHz
Sound : optional hardware giving wave-table SB compatibility
Screen:80x25 character display
728x1024 pixel graphic with 16million colours
Standard 102-key keyboard
8/16-bit expansion slot (up to 8 of them)
Super VGA output

No casette recorder interface
No VHF/UHF TV output
**** NOT COMPATIBLE WITH ORIC-1 SOFTWARE ****

Huh?
Oh I am dreaming ... it's actually a IBM compatible called ORIC-1000 :-)

That depends, if your using TOS 1.4 or older (which you most likely are on an ST) you will need at least a program called Serial Fix, there is a program called HSMODEM that might* speed things up, but I havn't had time to fool with that one, and I only have a 2400 baud modem anyway...

Eh, don't bother with the original PC-DITTO especially for things like C compilers, its too* slow on an 8mhz machine! (It's 100% software) There's a PC-DITTO II out there, which is hardware emulation, never goofed with that one.

I've heard of a patch for that, I dunno where to get it, the bug is due to
you having more than 2 megs memory! Making a 14 meg ramdisk would be a
good temporary fix.

Hi ALL

Just to make the newsgroup COMP.SYS.ATARI.ANNOUNCE more public I post the
latest
article from the moderator of the group here!
I furthermore want to mention that this group is imported into the German
MAUS-Net, too, where almost all ATARI-Users and lots of programmers can be
reached!

If you want to know quicker information about new realeses of german-shareware,
please contact the authors and tell them that they should use that newsgroup
(even the German programmers). In the MAUS-Net the newsgroup is called
C.S.A.ANNO
or comp.sys.atari.announce.

Help to make that newsgroup a good connection between Germany and the USA!

From: announce@lexicor.com (Guidelines)
Subject: Comp.sys.atari.announce guidelines
Message-ID: <D95073.DKA@world.std.com>
Sender: Lexicor@world.std.com (ysiu@lexicor.com)
Organization: Lexicor Software Corporation
Date: Thu, 25 May 1995 13:59:26 GMT
Approved: Lexicor@world.std.com
Lines: 136

Guidelines to posting to comp.sys.atari.announce

if you have any questions or comments/suggestions
please respond to myself or reply.

This file should assist users who wish to post to comp.sys.atari.announce
and are not exactly sure if it will be approved:

When posting to comp.sys.atari.announce please make sure of the following:
* post about atari computer relevant topics
* please include an explanation to what the package/machine is in the post
* the post should be at least 10 lines long (message content)
* it should be informative

* What kinds of posts will not be approved?
Any post that is not relevant to atari computers (8-bit, 16bit/clones) will
most likely not be approved.

Details are in the charter, in general posts that sound like "there are some
news, please contact me" without any information on the product in question

will be rejected. Posts that appear to have a lot of spelling mistakes will most likely also be rejected (such as fairly obvious grammer and spelling errors). Posts are expected to be in english, if they are in another language then a translation would be nice, its hard to approve anything that one can't read.

*Can I post forsale posts?
Forsale hardware posts are generally not approved unless they come from a company/developer or dealer who wishes to announce new pricing for product. Comp.sys.atari.announce is not atari.marketplace (doesn't exist however).

* Justification/Charter
Please read the RFD, this should clarify a lot of questions, if you have any more questions please email me (ysiu@lexicor.com)

Original Request for Discussion: comp.sys.atari.announce

by: Yat Siu (Lexicor@world.std.com)

Group name: comp.sys.atari.announce
Status: moderated (Lexicor@world.std.com)
Distribution: world-wide
Summary: a newsgroup for the product announcement of atari computer hard and software or related (eg. clones).

Justification:

There are currently comp.sys.atari.st, comp.sys.atari.st.tech, comp.sys.atari.8bit and comp.sys.atari.advocacy, the first three groups are discussion forums for their (specific) related hard and software. Product announcements in these discussion forums of new releases by either commercial, shareware groups can often be considered a service but not encouraged. The atari computer market is not very widely distributed and it is getting increasingly harder to know more about new products.

To begin with a product announcement group would encourage the people to announce their new products for the benefit of all atari computer users. It will also allow the reader to focus for a new newsgroup only for product announcements or press releases and will also make the reader more aware of his/her options.

Charter:

The proposed group will provide a forum for the announcement and release of new atari related products:

* atari computer hard and soft
* commercial as well as shareware or related
* announcement from individual authors, companies or distributors
* press releases

NOTE

This RFD is being issued in concordance with the guidelines set in the "How to create a new usenet newsgroup" FAQ regularly posted to news.announce.newgroups. Please refer to this article if you have any questions about the newsgroup creation.

Unless the discussion indicated a need to resubmit a new RFD, the CFV will be posted approximately three to four weeks after the posting of this RFD.

--- cut ---

Bye

...Patrick

> The quewstion is : Should I buy the damn thing or not ?!

The Atari ST is an excellent platform for MIDI music. The interface is
built-in and comes standard with all models. The MIDI interface is well
supported by the operating system as a result.

The main problem would probably be memory. A standard 520ST has only
a half megabyte of RAM, and can NOT be very easily or reliably upgraded.
Memory upgrades ARE available though, up to the systems maximum of 4 Megs.

(Check and see if the 520 you're considering already has a memory upgrade
in it... many of them did have this done to them.)

> I heard it has a midi interface in it itself, but does it work properly ?

The only problem with the ST MIDI interface is that Atari implemented the
MIDI-THRU signal in a non-standard way, and some equipment may have problems
dealing with it if you use cables with all five wires connected. I don't,
unfortunately, know what equipment is affected by this. Many, many people
DID use the ST for MIDI music very successfully nontheless...

(Take a look at some Tangerine Dream albums sometime.. they used the ST..
also Madonna, the jazz "supergroup" Fourplay, and lots of others.)

> Since I can buy it for almost nothing, I'm curious if

At that price I'd say go for it.. and at least give it a try.

> check will only occur once in each execution and will incur no
> overheads to the system from then on.

> Beric..

This has merit in a monotasking environment.

However, in a multitasking environment, this is NOT recommended.

Imagine the following scenario :

1: I launch "ONE.PRG" which follows the above scenario.

2: I launch "TWO.PRG", which, not knowing that program one has set up FPU emulation, sets up it' own.

3. I launch "THREE.PRG", which does exactly the same.

4. Having used program two for what I wanted, I quit from it.

4.1 The de-initialisation code within that program restores the old LineF vector.

5. The memory used for program two is now allocated by another program for some purpose - storing disc directories, off-screen graphics, love-letters to "my sweetheart", and so forth. The bytes which used to handle floating point emulation are now containing complete gibberish (in the eyes of the CPU). Trying to execute these bytes would crash the computer.

6. Program three has completed it's usefulness, so it is now released.

6.1 The old value of the LineF vector (the emulator in program two) is now put into the LineF vector, restoring it to it's previous state.

7. Something happens which causes a LineF exception.

7.1 The gibberish in the LineF code gets executed.

7.2 The computer dies, taking your (unsaved) data with it

The only way around this is to have FPU emulation at the Operating System level. This guarrantees consistency (One program might only implememt just enough flexibility to make itself run - and other programs to think there is an FPU - and when some FPU instruction occurs that isn't emulated....

CRASH!

(The only exception to this that I will accept is a system extension/TSR loaded as the computer boots and remains resident while the computer is running. AS LONG AS IT CAN NOT BE REMOVED FROM MEMORY WHILST SOMETHING IS RUNNING.

: Try this address, it's where the Linux packages are developed for all
: platforms. Which means you get it straight from the source!

: FTP to -> tsx-11.mit.edu

: You must read the small online doc files. They will lead you to the
: Atari specific files. Everything is there, Atari, Amiga, Mac, PC, etc.

I've always gotten my stuff from tsx-11, but I either figured out
what my problem was, or getting the latest 9pl6 kernel fixed the
problems. Now I boot MiNT in ST-Mono and use a shell to start
ataboot.ttp, and everything is happy. Unfortunately I don't have
any good SCSI drives, and am unwilling to partition my internal
IDE drive, so will have to try to find a cheapish 100mb or so
SCSI drive (or get a master/slave IDE cable that allows me to
extend the internal 2.5" drive cable to a 3.5" external IDE drive;
I've got a couple of 340mb drives doing nothing)

>the Atari's! I'm sick and tired of going "ooohh....aahh" at demos and
>still have to be stuck with lame-o Internet software. Grrrr....

I just got this demo and after managing to find enough room on my
hard disk I ran it. OK, it's fairly impressive and the music is
great, but then it locks up on the green tunnel with people doing
handstands. I know it's not a memory problem as I boot with nothing
else loaded. So it's a disk speed problem. My disk is quite fragmented
but even so I don't think there is any excuse for the demo locking up.
As a coder I know that it would not be difficult to make sure it never
crashes even if it couldn't get the data quick enough. It would just have
to go out of sync to the music. Later on it might be able to resync. I
suppose it could be a corrupted download but it dearchived perfectly so
I suspect the disk is the problem.

BTW, Lazer, the demo generates random colours in colour 0, is this a sign
that it has missed a trigger for the next effect?

Alan.

> Thanks!
>
> David (lamarth@delphi.com)
>
Think of TrueImage as a photographic processor using filters
to change or enhance the Image. No painting or drawing here.
Think of TruePaint as having thousands of bottles of paint
in front of you and a brush for repainting a picture on your monitor.
The best bet for printing would be to purchase ImageCopy 3.
There are PD programs like GEM View that will print (if you
have the time to download all the modules). But, for the cost of
both of these you can just about get Apex Media (if you have a
Falcon). I can't explain that. You have to see it in operation.
However, TI and TP are nice programs for all the Ataris.
Sorry for the simple and lenghty post.

Mike :)

Rubbish, Connect keeps up quite happily with a 28k8 connection, even
without NVDI.

> FZDSterm has heaps of features and is IMHO simple to use, but forget about
> trying to use it for VT-100/VT-102, it can't cope.

FZDSterm works quite happily with vt-102 - just select ANSI.

3519. Modem through supercharger

Newsgroup: comp.sys.atari.st
Date: 1995-05-26 00:00:00 UTC
From: foltin@cherokee.nsuok.edu
Message-ID: <D96sxJ.AHu@cherokee.nsuok.edu>
Source record: 164882

I have a supercharger with 1Meg and DOS 4.01.
I need to run my telecomm program with dos. It's a long story
why. The short of it is that this is the only way I can dial in
to work. We have to use Minisoft with an HP emulation.
Has anyone had experience with using telecomm software and modem
through the Supercharger? I need some help, please.
My modem will not dial.
The modem works fine when I dial with any ST-TOS based telecomm
program. The Supercharger works fine in running DOS stuff.
Here is my system:
STfm at 2.5Megs
Adscsi+ adapter running two hard drives
Supercharger connected to the adscsi out plug as per the
manual.
Practical Peripherals 14.4 baud modem set at 9600 and
plugged into the ST modem port.
External 720 drive.
Com port set at 2.

I have experimented with some settings, but I don't know enough
about telecomm.

Any and all help would be much appreciated.

Alternatively, if anyone has a driver to emulate an HP2392A
terminal on the ST, i.e. through TOS, then I would not have to
use DOS and MINI.

Thanks in advance.

Bela Foltin

Hi,
I have 4 1Mx8 BIT simms for sale. These are non-parity (non PC)
30 pin simms. They will work in old macs, I believe, and more
importantly, in STs and STEs.

Three of them are 70 nano-second simms and one is 80 nano-second.

I want $20 apiece or $75 for all four.

Terms are: You send me a check,
I send you the simms.

From: aa860@ccn.cs.dal.ca
Message-ID: <D97Hx5.GKz@cs.dal.ca>
Source record: 164896

Does anyone know if Llamasoft, creators of Colourspace and Trip-A-Tron are still in business? I've just been using Colourspace and would like to know if their 3 year old address is still good. If they are no longer in business, I would like to get a copy of the manual for Colourspace or a copy of Trip-A-Tron which they say is a more elaborate and flexible version.

Hallo Leute!

Nachdem ich Arne Rudolph mehrmals angemailt und geschrieben habe, sehe ich mich gezwungen folgende Nachricht, wie fuer ihn angekuendigt, in allen Atari-Gruppen zu posten:

Vorsicht vor der Registrierung von *Before Dawn*!!!! Arne Rudolph ist wohl nicht gewillt noch Registrierungen anzunehmen, jedoch schickt er das Geld nicht zurueck! /Bei mir war er sogar so dreist, einen Scheck erst nach Wochen/ /einzuloesen, wohl in der Hoffnung, ich haette mein Anliegen schon vergessen!/ Trotz haeufiger Aufforderung zu diesem Thema Stellung zu nehmen, hat er sich hartnaeckig *nicht* bei mir gemeldet!!

Ich finde dieses Verhalten absolut daneben. Und gebe allen Atari-Usern den guten Rat, Software von Arne Rudolph (@AC) zu meiden.

Es ist traurig, daï¿½ es Leute gibt, die den Sharewareweg so ausnutzen!!

Bis denne, Jochen ::-)

I'd recommend Chameleon, which allows you to load and unload DAs on the fly.
It loads like a normal DA (you can load up to 6) and you can then (automagically
or manually) load well behaved DAs into it (note that they must be well
behaved - the likes of Harlekin 2 don't like it at all, presumably 'cos they
want a early run at the system vectors). Also worth getting is the Chameleon
configuration util.

They're both PD and at the Atari archive (and mirrors) and HENSA.

: FZDSterm has heaps of features and is IMHO simple to use, but forget about
: trying to use it for VT-100/VT-102, it can't cope.

I dont know what it is with you guys and Freeze Dried, I am at the moment
(as i always am) in VT100 on my net site. I HAVE NO PROBLEMS with my
display whatsoever! That also includes the scroll back buffer. I dont
get ANY ansi codes or other spurious codes at all. There is only one
thing that i have found Freeze Dried does not like and that is when
i do a /list in IRC!

I have Connect, Stalker, Storm, Vanterm, ANSIterm, Teddy Term (and the list
goes on....) and FZDT is IMO the best.

BUT!!!! It took me quite a while to get it working properly on VT100 etc
displays. If you are prepared to work on it a bit, then its Great regardless
of the fact that AARON HOPKINS let everybody down. 8-)

3543. My E drive is poked ...

Newsgroup: comp.sys.atari.st
Date: 1995-05-27 00:00:00 UTC
From: Bob Brown <bob@earthlight.co.nz>
Message-ID: <Pine.SUN.3.91.950527195552.10323A-100000@earthlight.co.nz>
Source record: 164817

Hi there ....

I tried to install MiNT the other day ... READ ON! This is not a 'I need help with MiNT installation' message. After Miniting my E drive, everything seemed to install ok, but I had big trouble with unstable Inodes and well, it just wasn't worth the hassle.

I'm running NeoDesk 3, so I grabbed drive E and threw it in the trash. That didn't fix it. It's a 10 meg drive, but I only had 2 meg free on it and whenever I saved a file, heaps of other files & directories would pop up from nowhere.

I ran ST-Knife and thought to myself .... Compare the FAT's ... I did that, and they were both way out of sync. Copying Fat 1 to Fat 2 had no effect, so I killed the Boot sector for the drive (logical sector 00000).

Bad move ...

TOS now tells me that I have a TOS error #-37 (Path not found) error when I try to show info on drive E under NeoDesk. Knife wont do anything to drive E because it has a Non Standard Boot Sector.

I've tried HDX v5 to zero the drive, but it just complains that it's got an invalid boot sector.

I don't want to save the info that's on the drive, just reclaim the lost space so I can download more stuff! Any help would most definately be appreciated!

Thank you very much in adance ...

>if that makes a difference..)

Get a (new or used) Link1 or Link2 and a SCSI drive in an external case. It'll cost a bit more than an old Megafile 20 or 30 (which can be had for about $100)).
But the ability to add other SCSI devices to the chain will more than offset thecost of the SCSI! I run a 120 meg hard drive with a 21 meg floptical for backup
purposes and a 3X CD-ROM to boot! All running off a Link1 with the very nice ICD software. I love every minute of it! Fast, solid and easy to back up!
Pardon the formatting of this post - Delphi's Usenet server is acting strange!

One shop, one month. And I don't know how much over 20K it's done - they just put gold stars by the stuff that's done 20K+, silver by the ones that have done 10-20K etc. What we need is someone from DV to expand on this (can you hear me, Paul Wiffen? We know you're out there somewhere.)

Hello,

Auch! that reminds me of my hard drive problems while installing/de-installing Minix. I heave tried *a lot* to make this work, but failed...
Perhaps you could try editting the bootsector manually, if you have got the appropriate docs, that should not be impossible.
I took a weekend off, backed up by harddisk, reformatted it and put everything back. (My HD is only 48 Meg). Good luck!

Fritz, I think we all know the feeling. Its a shame Atari let its marketing structure collapse. I wonder if it will ever come back, but am not holding my breath. I stick with the platform because I have it and because of the wide circle of friends I have made in the Atari community over the years.

I also try to contribute little to the effort by making Atari amateur radio software available on my home computer/BBS.

Ben's Place, as I call it. Specializes in ham software for the Atari. It can be reached at 407 659-1961 and is located on the campus of Palm Beach Atlantic College, West Palm beach, Florida.

OK, I got a 1040 St. I have no software, nada, zip. No terminal programs, no games, nothin. I will pick up a modem sometime over the weekend, but I have some questions.

1. If I buy a 14,4 Modem, am I gonna have a problem with the serial port?

2 Where can I get some terminal software and fast.

3. Can I use my IBM PC to download stuff, in other words are the disk formats in anyway compatable? That way I could use my Pc to download terminal software.

4 Are there any good boards where I can get some games and stuff like that.

5 Is there a WEB browser, or anything that works with TIA

6 I also once heard your could download and play Sega Genisis games On an ST, is this bullshit?

Any Help would be appreciated.

Think yourself lucky. Frontier: First Encounters is the most bugged
piece of software on the face of the Earth, and GameTek are currently
withering under the number of complaints about it. Plus Ian Bell is
most displeased because David Braben is using the Elite name without
his permission. Elite is the only one of the trilogy worth playing!

What machine gun? Where on the first level is it? I have gone up to level three (press 1,2,3 on keypad to go to that level once you are in the elevator). I have got the red and yellow IIRC keys and met a new monster which is harder - it lobs green balls at you.

>- >I'd sooner write my own than to pay the $260 that I've seen GTLook2 going
>- >for...
>- >

There is also a shareware Epson scanner 'GDPS' driver
(GDPS_SC.PRG) which I picked up on a UK bulletin board, I don't
know any FTP site for it.

Unfortunately it's all in German, (though it doesn't seem that
complicated,) and I don't have any program that uses it...

>- it depends entirely from who and where you purchase it from too. Support your
>- dealer, but that price is way too high.

In the UK it is £149 from System Solutions. The exchange rate not withstanding, the same products in the USA are often the same price in dollars...

>- Yat @ Lexicor

So how much do Lexicor charge then?

P.S. Does Lexicor have a web site?

3557. Anyone Want To Buy ATARI-ST Software?

Newsgroup: comp.sys.atari.st
Date: 1995-05-27 00:00:00 UTC
From: brianj@wantabe.com
Message-ID: <3q7hr7$dol@tattoo.sccsi.com>
Source record: 164831

I recently sold my Atari 1040 ST, but I still have most of the software for it. All of the titles I have are originals with the original box and documentation. Drop me a line if interested.

Shadowgate
Airball
Omega
Pirates!
Roadwar Europa
Annals of Rome
Universal Military Simulator
Populous with the Promised Lands Expansion Disk
Ferrari Formula One
North and the South
Middle Earth
Captain BLood
Oids
Rogue
Paladin
Carrier Command
Empire 2.05
Elite
Questron II
Starglider
Test Drive
Conqueror
Universe II
Hunt for Red October
Mark Williams C (C Compiler for the Atari ST)
Dragons Breath
Flight Simulator II with Hawaii Scenery Disk
Falcon with the mission Disk
Drakken
Midwinter
Space Quest III
Defenders of the Crown
The Bards Tale
Combat Course
Bloodwych
Flight Command Pack (skyfox II, Strike Force, Harrier, Lancaster, Eliminator, Skychase)
Manhunter I
Dungeon Master I
Dungeon Master II

Major Motion
Terrorpods

If interested, drop a line to brianj@wantabe.com
Will sell most for $5.00 to $10.00 plus postage.

Should work on any ST/STE/MegaST/MegaSTE/Falcon/TT with 4 MB RAM.
These can all run the MiNT/X11R5 setup necessary to run the Chimera
graphical WWW browser and MintNet.

3559. Atari A to Z book

Newsgroup: comp.sys.atari.st
Date: 1995-05-27 00:00:00 UTC
From: msbaines@cix.compulink.co.uk
Message-ID: <D98xBD.FxK@cix.compulink.co.uk>
Source record: 164833

Reviews are imminent in all 3 UK Atari mags - in fact the next issues I believe.

The Atari A to Z
by Mark S Baines

Jargon, terminology and acronyms are the staple diet of any professional, technologist and hobbyist. The world of computing is no exception and to the uninitiated home or small business user, magazines, manuals and books can be very daunting. Written by someone who understands these frustrations and needs, The Atari A to Z is an encyclopaedia of modern computer terminology specifically pertaining to Atari computers.

Whether you play games on an ST, run your business on a TT or write music on a Falcon, this book is aimed at helping you get to grips with magazines and books that are more perplexing than enlightening. In it, you will find definitions, explanations, mini-articles, tables and lists to help you gain a better understanding of your Atari computer. The material in this book was written with all Atari users in mind. There are simple definitions for the uninitiated and technical data for the experienced. You take what you want, when you want it.

The Book
The Atari A to Z is produced in A5 format, 340 pages long and contained in a quality ring folder for convenience. It contains 2,238 entries, 101 tables and 128,000 words. There are five appendices - Addresses, Book List, Connectors, Extensions, Atari ASCII set, ANSI Character Set.

Firstly, this is a comprehensive general computing dictionary, there being entries for all the common terms and acronyms found in modern day computing. Like any computer user, Atari users require help with terms not specific to their particular machine. They should be able to find what they want here.

Secondly, there are entries of Atari-related terms and acronyms which cover all the Atari computers and consoles. There are expanded explanations and essays, tables and lists which together form a comprehensive inventory of material that The Atari Compendium left out and not found elsewhere. The table of System Variables is more accurate than that in The Atari Compendium. There is a list of Exception Vectors, Atari Cookies and their meanings, Memory Maps for all Atari computers (and more accurate than that in The Atari Compendium), a full Breakdown of the DESKTOP.INF and NEWDESK.INF files (not found in ANY other publication), Errors Messages and Bombs, Pin

Connections of all the ports on all the machines, Technical Specifications of the whole Atari range, a Breakdown of the TOS Versions and the differences between them, an explanation of GDOS, MultiTOS, the VT52 emulator and codes, all the main chips, viruses, a light-hearted look at computer laws, a list of common file extenders and their meanings, a list of contact addresses, a bibliography... this is just a little taster of some of the important aspects of this book. The Atari A to Z is thorough!

The Author
Mark S Baines is a highly experienced computer user having bought his first computer in 1982, been on the communications networks since 1983 and the Internet since 1993. Holding Bachelor and Masters degrees, he was once a secondary school teacher of Biology, Computer Studies and Information Technology, a network manager and school administrator. Mark left the profession after twelve years to move to his beloved Highlands to pursue a more benign lifestyle. He currently runs Linnhe Computing, carrying out training, consultancy, freelance writing, journalism, export and anything else that takes his fancy! Mark has written regular columns and other articles in various magazines for several years, including more recently ST Applications, ST Review and Atari World.

Availability
The book is only available from:

Linnhe Computing
Linnhe, Shore Street
Inver, by Tain
Ross-shire
IV20 1SF

Price
UK
The cost is a very reasonable £12.50 including postage and package.
Payment is by Cash, Cheques (drawn on UK banks only) and Postal Orders only. Cheques must be made out to "Mark S Baines".

EEC
Including postage - total £14.10

US and Canada
Including postage - total £17.00

Australia
Including postage - total £18.10

PLEASE NOTE: Only UK cash, cheques and postal orders (available in Canada and Australia) are accepted. DO NOT send anything else! Ask your bank about the *cheapest* way to send UK money to the UK for just send cash safely wrapped to avoid detection.

Special Offer:
If you add an extra £5.00 I will send you the latest version of
PROFILE 2 - the best and most thorough system analyser for all Ataris
- a full and modern GEM interface and Falcon, MultiTOS, MagiC and
Geneva compatible. This program is shareware and your registration key
will be included together with other Linnhe Computing software.

3560. Substation Demo: Passing

Newsgroup: comp.sys.atari.st
Date: 1995-05-27 00:00:00 UTC
From: Conan Ford <ford@freenet.calgary.ab.ca>
Message-ID: <Pine.A32.3.91.950527134151.49930C-100000@srv1.freenet.calgary.ab.ca>
Source record: 164834

If you don't want to know without discovering it yourself, do not go onto the next page. Following is helpful hints for the people who have explored the game a bit.

^L

Hints for passing SubStation:

1) On the first level, kill all four black spiders and the 3 metal scorpions. It is often easy to kill all the four black ones by staying in the starting room and opening the door again and again. As they venture in, blow their spider brains away.

2) Get the ammo. from where the metal scorpion comes out of. Kill the others in the computer room. Move to the left side corner and then turn right. Opposite you, a hidden door revealing food will have opened on the other side of the room.

3) Go to the elevator and go to level 3. Exit the elevator and wait for the two metal scorpions and remove them..

4) Go forward through either hallway. Turn right, and note a door on your right which needs a key (this I will call door A). At the end of following the turns of the hallway is another metal scorpion. Kill it, and get the key and bomb, back out into the main hallway, and keep pressing <SPACE>. A hidden door will open on one side. Go in, kill the black spider, and take the bomb. Go back to the elevator and go to level 2.

5) Note the door straight across the hallway on level 2. I will call this Door B later. Kill the machine gun guy. Turn left, and then turn left at the next open hallway. Kill the other machine gun guy. Go to the end of the big hallway without a door at the end, and stalk the metal scorpion. Go back to the other end of the U-shaped hallway where there are doors. Approach, back up, and kill the spiders as they come out. There are 3.

6) Go into the canteen (the room you just approached with the spiders in it. Get the subgun. Back up at a diagonal to the side of the room of a door and it will open. Exit, and go back to Door B.

7) Switch to handgun. open the door and kill the scorpions. There are 4 scorpions in here. Some may be on the left or right. On your left is a large hallway with recesses on the side where some of the 4 scorpions may remain, and there is also extra revolver ammo. get the ammo. Switch to subgun, and kill the fire guy with the subgun or the bomb. There are two big guys here. Use the slide (Insert, Clr Home) to avoid their fireballs.

8) Enter the place where the big guys were. Be careful of the machine gun guy which may appear when you are in here. Follow the circle around and note elevator 2 on the right. Continue around and get the med kit if you need it. Use elevator 2 to go to level 1, get rid of the machine gun guy here on level 1. Get the key on level 1. Go back to level 2 on elevator 2.

9) Go to Door A on level 3. Enter and get rid of everyone.
When you follow the passages around, a door will open on one side, and a yellow key will be inside. Get it and go back to elevator 2 inside door B on level 2.

10) Use elevator 2 to go to level 3. Exit the elevator and kil the two big guys. Enter the center door and pass the level (switch on the wall).

Medkit locations: Level one straight accross from the elevator, Two doors on sides of hallway that you come from in level 1. Computer room hidden door on Right in level 1. Level 2 on side of U shaped hallway hidden door. Level 2 near elevator 2.

Finding hidden doors: walk down hallways, and watch for what appear to be doors on the sides (as in openings. BIG openings). Try to open these the regular door way, or try moving around the area a bit.

Tips: The sliding feature is a life saver. Don't overuse the subgun.

Good Luck.

Just curious here, John-you named just about every Atari computer.
When you say "will only run", what else were you thinking of running
it on? A portfolio? :-) I really don't understand your question.

: Cheers

: Anthony

Yep, use PAPYRUS for text doc's, LDW for s/sheets and twist2 for data

Though the above are 3 different app's it's still less trouble (and better
performance/features) than works... IMHO of course..

:
: You see, there's other benefits you get from an OS that "just supports
: it". For example, when I install a font in my Mac (or PC or Atari), ALL
: the programs use it. Period. The same is certainly NOT true for TeX
: (who's font handling gives me the shakes).

And then you go to a friend and he can't load the document because
a font is missing, or want to print it at the schools 600 DPI Laser-
printer which doesn't has this font. And you know nothing about
PostScript to download the font to the printer.

3574. New Falcon prg!

Newsgroup: comp.sys.atari.st
Date: 1995-05-27 00:00:00 UTC
From: mandus.soderberg@master.ct.se
Message-ID: <ftn_2.203.203$fidonet.org_2fc76c88_Mandus.Soderberg@master.ct.se>
Source record: 164848

A demo version of Rainbow II Multimedia can now be found on: ftp.cnam.fr (/pub/Atari/Falcon/Graphics/r2mfixed.zip)

Rainbow II Multimedia is a Falcon specific program with features like: Picture Studio, Sound Studio, Photo Studio, Slideshow Studio, Sprite Studio ...and also a built-in game.

This is too much! Just use HSMODEM! You don't need all the others!

> I can't get transfer rates over 1,600 CPS on my 28.8, which is just
>plain strange. I should get 3,600 throughput, since the port is set for

>problem is on my end. Of course, maybe the problem is that the remote
>modem doesn't support v.FC/v.FAST? My modem doesn't have v.34 :(

That's the problem! You've only a 14k4 connect. And so you can't get much
more than 1620 CPS transferring packed data. But you can transfer
unpacked data - THEN you shuold get 3000-3500 CPS (if the computer
on the other side is fast enough...).

> Another problem, I can't set the port over 38.4. If I set it
>higher, I get no response from the serial port. When using MiNT, I use
>the standard U:\dev\AUX device, and when not, I use modem2 (which is
>correct). So, what gives? I'm tired of my 28.8 performing like a 14.4

Well, IMHO your modem does not allow more than 38k4. Maybe it allows
57k6, but in this case your port does not allow 57k6....

> Thanks for any help :) BTW, I'm using CoNnect.

CoNnect is really the best!

>Apparently, it's supposed to be more efficient than ICD's one, what I want
>is a program that caches Directory+FAT seperately to data, or even better,
>one that scans the drive and gives information on optimum cache/buffer
>sizes etc.

Well, TCache optimizes the cache without any parameter. You've only
to install the size and some other parameter. TCache works VERY efficient
and is faster than all other caches I know. There is no reason to seperate
DIR, FAT and DATA. (The only effect seperating these caches is that you
need more cache....) TCache takes *always* exactly the needed space for
FAT and Rootdir. So there is never unused cache. This works independent
for every partition.
But if you WANT it, you can activate the option 'lock root/dir'. Then you
have seperate Caches....

You've only to pay attention to two facts: first some (!) HD-driver don't
like TCache running in FastRam. And second you should disable ALL other
caches.

I now use TCache for more than two years, and I had never any problem with
it.

Some facts (on my TT): with 1 MB cache I have over 90% cache (read) hits.
A cache (read) hit has a transfer rate over 7 MB per second.
I have over 90% write hits. And every write hit saves much time!
For example, depacking a 3 Mb LZH archive (with 2600 files) takes
with TCache 240 seconds. Without TCache it takes over 600 seconds. And
I really have a very fast harddisk....

Hello fellow Atari users! I am interested in finding out if there are any public domain game creators of any kind, and where could I find them? I would be interested in text adventure creators, graphic game creators, anything! If you know of any please let me know the ftp site or perferably the web site! I have a 1040 STe with one meg and a 540 meg hard drive. Thanks in advance to all who respond!

I use Connect 2.46 which handles very well those emulations !
It is Shareware. Depending of type of your modem it can be
used as an answering machine too (Zyxel).
Fax is not available (yet).
Shareware version have time limit (30h usage).

I think it's called >conn246e.zip> in verious atari ftp-sites.

Well no one has ever got it to work on this DEC site, it does not Support VT100 at all, in fact I would rate it as 200% RUBISH, no ARGV support, can't use GRZRZ with it and its programed in GFA Basic..

FZDT is mostly used here by Teenagers, has all the glits that they like..

But as they say all that glitters is not Gold....

Ok, so TrueImage doesn't do much else that GemView does, and from what
someone else just told me I should steer away from TruePaint altogether.

I've got a copy of the Apex Media demo, and aside from the fact that (at
least as far as I can tell) it has no hardcopy capabilities, otherwise I
probably would've bought it by now :)

Could it be the mouse port that's giving problem. If that's the case,
getting another mouse won't help. I just got mine repaired. The contact was
bad and a drop of solder helped solve the problem. Got to be careful if
you strip the keyboard apart though.

>> Isn't 2.0Mb the *unformatted* capacity??
>
>Yes! Thats what I just said! Alot of that 2 megs is taken up by sector
>gaps, directorys, etc...

Its very easy to get 1.7 megs on 1.4 meg disks, this is the same as the 11
sector format used on the Atari...

PC used 9 sectors with DD disks so 9*80*512*2 = 737k, the
HD format is just double that 18*80*512*2 = 1,474k..

So useing the 11 sector format on a HD disk it would be 22 sectors...

So 22*80*512*2 = 1,802k...

11/22 sector formats should never be used for read/write as the gaps are very
small, but should be ok for write once read many times and no good for drives
that run fast...

That's odd. Since since Falcon's doesn't come in 2 MB versions.
My 4 MB Falcon has no problem saving a game in TOWERS II.

The problem could be running TOWERS II from an external harddrive
instead of the internal IDE. TOWERS II patches can be found at
ftp.cnam.fr.

Well there's something around here that 200% rubbish so you got that bit
right.

I don't see GFA Basic has any bearing on the matter, you can program
properly and poorly in any language.

> FZDT is mostly used here by Teenagers, has all the glits that they like..

Really. Did a survey did you, out on the street asking lots of teenagers if
they use FzDT?

If someone started doing that around here I'd begin to get a litte worried.

Hi,
I have a friend in England who has a 1mb STE. She wants to get on email,
but doesn't know where to start, and as I know nothing about the STE, and
very little about what's what in England I can't help her. So if anyone
from the UK could help me with the following questions I would be very
grateful...

Will any modem work with the STE?
What software is best (preferably shareware)?
Where/How does one get an internet/email account in the UK?
How much does it all cost (equipment, software and email account)?

email replies preferred but not essential,

TIA

3595. Where can I find LaTeX2e for Atari?

Newsgroup: comp.sys.atari.st
Date: 1995-05-28 00:00:00 UTC
From: kentv@ifi.uio.no
Message-ID: <3q9qil$4ul@mimir.ifi.uio.no>
Source record: 164770

I already have LaTeX 3.14 installed, but would like to upgrade it to LaTeX2e. Does anybody know of any sites where I can get the upgrade or a complete installation?

Thanks;

Kent Vilhelmsen, University of Oslo, Norway

3597. Mega ST 2, Tons of Software for Sale (Long Post)

Newsgroup: comp.sys.atari.st
Date: 1995-05-28 00:00:00 UTC
From: tgrel@aol.com
Message-ID: <3q9u4g$n6f@newsbf02.news.aol.com>
Source record: 164772

*** Long post warning *** Mega St and 'accessories' for sale!

All items are at least 4-5 years old. I don't have the latest 'anything'.
I'll leave that up to whomever gets the system. All software comes with
boxes and doc's unless otherwise listed. I got alot of this stuff when I
bought the system, so I've never even run it myself.

Please Email >>>dcard@spectra.net<<< with any questions, offers.
As a ballpark figure, I'm looking in the neighborhood of $450 for
everything.
Shipping costs will be the buyers responsibility. I will only sell it
C.O.D. and as a warning the shipping will be over $50 (I'm positive of
that).

Here we go....

Hardware

MEGA ST 2
Mono Monitor
Color Monitor
Monitor Master
85 Meg ICD hard drive (needs new power supply)
360k 5-1/4" external floppy drive
Okimate 20 Color Printer (three black and one color cartridge)
Avatex 1200 Baud Modem
2 Quickshot Joysticks

Software

Simulation

Falcon
Falcon Mission Disk 1
Their Finest Hour
Red Storm Rising
Gunship
Midwinter
Fighter Bomber
Carrier Command
Starflight
Tracker

Sports

Wayne Gretzky Hockey
MicroLeague Baseball

Sierra Adventure Games

Colonel's Bequest
King's Quest II, III, IV
Hero's Quest - So you want to be a Hero
Space Quest I , III
ManHunter / New York
Police Quest I

Other Adventures

Dungeon Master
Dungeon Master - Chaos Strikes back
Ultima IV - Quest of the Avatar
Zak McKraken and the Alien Mindbenders
Star Trek - The Rebel Universe
Space Ace
Drakkhen
Paladin
The Pawn
Bard's Tale (I think a disk was bad)
Infocom - Hollywood Hijinx

Arcade/General Games

Barbarian
Obliterator
Oids
Xenon 2
Sim City
Populous
Populous - the promised lands
Risk
speedBall
SpeedBall 2
BlockBuster
Vampire's Empire
Monster Grand Slam
Prince
North and South
Armada

System

NeoDesk 3.0
NeoDesk Developers Kit
NeoDesk CLI
PC Ditto

Minix
Revolver
Turbo ST v 1.6
A&D Universal Item Selector II v2.0
ICD utilities

Word Processors

Word Perfect
Neocept Wordup
Neocept Fontz
Thunder Spellchecker
Mavis Beacon Teaches typing (bad disk I think)

Graphic Editors

Spectrum 512
Unispec
Touch Up
Cyber Paint

From Basic to C
Learning C Programming Graphics on Atari ST
Computes ST Programming Guide
40 More Great Simulation Adventures
Runaway USA

OK. Whew. There you have it. A complete (of what I could find) list of the goodies I have. I also have all the STart Magazine disks, Computes Atari ST
disks, and various other disks from Mags gone by. I don't REMEMBER throwing
away the mags themselves, So I'll look again if your interested. All this will probably fill 5 or 6 large boxes (at least it does now), thus the large
shipping fee. But hey, sell off the extras to recoup some of the cost.

I'll be watching the Email, so all those interested....

Dave (dcard@spectra.net)

3598. Items For Sale

Newsgroup: comp.sys.atari.st
Date: 1995-05-28 00:00:00 UTC
From: Simon King <simon@kingres.demon.co.uk>
Message-ID: <74_OASIS_@kingres.demon.co.uk>
Source record: 164773
Cross-posted to: alt.forsale,comp.misc.forsale,comp.forsale.*,comp.sys.atari.st

For Sale

I have the following items for sale

Atari 520STFM
Switchable TOS 1.02/2.06
4 Mb Simm memory
The Link(DMA-SCSI)
40mb Quantum HD
45mb removable Syquest drive
Hayes Ultra 96 (V series Ultra Smartmodem 9600)

All the above is in a Lighthouse tower case with a seperate keyboard.

I also have a Amstrad mono monitor which is wired up to run of the ST.

For obvious reasons all the items marked with a must be sold together!

Epson LQ1050 printer.

2 x 45mb removable syquest carts.

10 x 88mb removable syquest carts.

Syncro Express copying cartridge.

Personal Scanner 64 400 dpi hand held scanner.

Execufold automatic letter folding machine.

British Telecom Bell 50E (A loud bell for in-door use only. REN=1).

TV signal amplifier. This amplifier is wired in directly aerial in, tv out.
Requires mains supply.

2 x Micom M414 Baseband Modem (Tricom Borer). I don't know exactly how these
modems work butI beleive that they are mean't to be permenantly connected.

Micronetwork Fax manager 3300. Lets you to use one phone line for voice / fax /
answer phone.

AccoData Large printer muffler.

Universal Mouse Trap with large sticky pad.

Interested in anything ?

Then make me a offer via E-mail (simon@kingres.demon.co.uk) please.!!
==========

As I don't always take this group ! Thanks

Source record: 164775

Sorry I don't have the answer to your problem but I noticed you have a
14.4k modem which you set at 9600. Just so you know, you are not limited
to 9600 bps on an ST. Although the older control panels only let you set
the RS232 rate to 9600, newer ones, as well as most terminal programs
themselves, let you set it at 19200, which is what you need to set it at
to have your modem communicate at 14.4k to whatever you're calling.

CHRS: IBMPC 2
Can anyone advise if GEMSpooler can be used to operate via the serial port at all? Ideally I'm looking for something which will take in an ascii file (via drag and drop) and then set the serial port to 2400 baud pass the file down to the printer, and then return the port to 19200kb.

Any ideas anyone?

Daron - dbrewood@nest.demon.co.uk

: OK, I got a 1040 St. I have no software, nada, zip. No terminal
: programs, no games, nothin. I will pick up a modem sometime over the
: weekend, but I have some questions.

: 1. If I buy a 14,4 Modem, am I gonna have a problem with the serial
: port?

The serial port maxes out at 19.2k ... most of the time you won't have a problem with a 14.4k unless you're downloading an uncompressed text file or something, then you'll hit the cap of 19.2k ... it's cheap and easy to upgrade, though.

: 2 Where can I get some terminal software and fast.

atari.archive.umich.edu in /atari/Communications/

I'd reccommend ANSITerm for a fairly basic (but fullly ANSI compatible) term program, or Freeze Dried Terminal for all-out features (And a bit of a gaudy interface to boot)

: 3. Can I use my IBM PC to download stuff, in other words are the
: disk formats in anyway compatable? That way I could use my Pc to
: download terminal software.

So long as the disk is formatted to 720k on the PC, no problem; the ST and PC disk formats are the same.

: 4 Are there any good boards where I can get some games and stuff
: like that.

Quite a few.

: 5 Is there a WEB browser, or anything that works with TIA

Yes, but it runs under the MiNT operating system, which would be quite difficult for a novice to install. (It's a Unix-like graphical OS)

: 6 I also once heard your could download and play Sega Genisis games
: On an ST, is this bullshit?

Very much so.

: Any Help would be appreciated.

What the question is asking is, will the software in question run on a basic, Atari computer? I have a 1040STe w/4 MB and only the Warp 9 screen accelerator. Is it worth me getting this, or would I need a real accelerator board (ie. PAK/68) to get real use out of this?

Hi,

Connect doesn't like my modem or the other way round. Anyway, Connect doesn't want to dial a number because it always thinks it's online. From reading the help I think it's got something to do with the modem settings. I guess some AT... command would fix it. Does anybody have a clue as to what the command might be? It's an AT&T Dataport 24.4/FAX modem.

advTHANKSance,
Tim

If you have an ST/STe and you want full 16-color ANSI graphics,ANSITerm/Taz
is as good as your gonna find, if you have something capable of generating
640x200x16 or better (TT/Falcon etc...) then I'd recommend finding
something called "Teddy Term".

Without a real* terminal program your in a catch-22 situation, you need to
learn Hayes commands. While your in the VT-52 emulator hit the Help key
and make sure your baud is set at 2400, ignore all other options for now.
Now click the OK button, you should return to the mainscreen. Type "AT",
then hit return, if everythings connected right, the modem should answer
with "OK", if you do* get an OK, then you can try dialing a number, type
"ATDT555-5555", replacing 555-5555 with the number in question, of course.
Now hopefully you should get a "CONNECT 2400" message, if you get a "BUSY"
message, then the numbers busy of course, keep trying.

You can't download files with the VT-52 emulator, so you need someone to
give you Vanterm or a similar program on a floppy disk.

Format a PC compatable 720k disk, I've had good results using a PD program called Diamond Format for the ST, The Amiga will read this disk using a program (I think) called DOS2DOS, the newer Amigas come with this. I don't know much about Amigas so don't ask me where to get this program if you don't already have it. The Atari will happily read the disk without any help.

Don't worry about this problem, this only cropps up when using el-cheapo
nonstandard MIDI cables that wire pins 1-2 and 4-5 together.

Now we woulden't wan't to scare away a potential new Atari user now would
we? ;)

Yea, my 'puter had a problem with this, lucky me I have an old 520ST with the joystick/mouse ports on the side, I just opened it up and resodered it, been working great ever since. If you have a newer model with the mouse port in that god-forsaken position under the keyboard, it gets very* hairy!

And a question on a remotely similar topic, mostly cuz my OLR crashes when I enter a message that isn't a reply:

I have an Atari CX80 trackball bought many years ago for use as a joystick with my dads 1040ST, it was shoved in a closet after buying a real* joystick, (it makes a crummy joystick for most purposes) Now that I have my own 520ST system, I dug it out of the closet wondering if it would work as a mouse, so I plugged it in, stuck it in trackball mode, and flipped the 'puter on, well it didn't work. So I wrote a quick and dirty GFA basic program to display the current status of the joystick port, and discovered that it encoded the movement data differently. So has someone written a driver for one of these beasts? I'd like to connect it for the niftyness factor if nothing else... :)

> "PC-Ditto" seems to be the > cheapest... would this work for me?

pc-ditto would probably work.. the biggest problem is its speed and graphics emulation. It can be VERY slow, although it does work. I don't remember for sure (it's been years since I sold mine), but I also think it only emulates CGA. That might not be a problem depending on what kind of programs you need to compile.

In any event, used copies of pc-ditto are not very expensive (when you can find them), so you could probably give it a try without risking more than about $20-$25.

It's not available at any ftp sites. You have to get it from the author
or some of the BBS supporters round the world. The Fortress BBS in the Uk
with Kevin Osborn as sysop have it. Al Petersen in the US have it, (can't
remember his BBS name now). And i have 8-)

I'm probably sticking my head out to get it chopped off here, but are you
sure it's an SM125?
AFAI remember, the SM124 and 125 were both 12" mono monitors, there being
some minor differences in cicuitry and case. The 14" Atari monitor was the
SM144, which _would_ give the much larger picture area.

Of course, you may know different....

3623. NEAR*US Swap Fest

[Cross posted to CSAST]

Northeast Regional SwapFest

On June 17, 1995, a regional SwapFest will be held to promote the NEAR*US movement (Northeast Atari Regional User Support, a proposed umbrella organization of Atari usergroups).

The location has been set for Bethpage, New York (on Long Island). The meeting hall of a public library in the area has been secured to assure adequate facilities. Details on time & directions to the area will be given in future postings.

This SwapFest is open to Atarians of all persuasions: 8-bit, ST, & game machines. Although the main activity will center around folks who want to look for bargains (or sell/trade your "junque" for someone else's "treasure"), some special events are also being prepared.

For ST Atarians, a featured guest speaker has been invited. Details to follow later.

For 8-bitters, I'm hoping to demo Nir Dary's NTSC/PAL upgrade. I spoke to Nir earlier this week & he promised to send me either one of his upgrade kits or an already-modified 130XE in time for the Fest. This upgrade holds the promise of opening up the entire North American 8-bit market to European software producers who currently are isolated by the incompatability between European PAL & North American NTSC video technology.

Information about the Fest & NEAR*US may be obtained from the Interim Committee chairman, Jon Mordosky, at: j.c.mordosky@genie.geis.com.

Stay tuned for further details & updates on what will hopefully be the largest USA East-Coast Atari SwapFest yet!

Yes, the STE has a standard serial port (up to 19k2 without further
modifications).

>What software is best (preferably shareware)?

HSMODA06.LZH (serial driver, Shareware?) and UPoint light (Freeware).
I don't know whether there are English versions and docs floating around,
though. Both are originally German programs.

UPoint allows Mail/News access via UUCP only, but that should serve your
purpose, as anywhere where one may get SLIP, one will also get UUCP
access.

Pekka Saarinen (contacts@mits.mdata.fi) wrote:
: Could you post these instructions here, please? There are many of us
: here who have no access to Compuserve.

Here is the file from Compuserve that Bob Retelle sent me via email. But I don't know if it would work on anything but a Microsoft version 1 mouse. Looking at the diagram, it doesn't look like the Microsoft v1 mouse connector was a DB9 pin or a 6 pin PS/2 connector. It looks like some custom thing. All the mice I see sold today have either the DB9 pin connector or the 6 pin PS/2 connector. Neither one of which I have the pinouts for. But here is the file, I don't know who wrote it. Let me know if you can decipher it:

==========

Subject: How to hook-up a MicroSoft mouse to an Atari ST

Here's a repost of my article of wayyyy back (Feb 1989) on how to hook an Microsoft mouse to an Atari ST. No software changes are required. All it takes is creating a special cable between the mouse and the Atari.

I've been using a Microsoft mouse now for around 2 years on my 1040, with nary a glitch. It's so much better than the Atari mouse, I'd never go back. (IMHO)

Well, here is how to connect a Microsoft Mouse to an Atari ST. (520/1040) The Atari has a 9-pin D-type connector. The Microsoft Mouse has a rather strange connector on the end. To prevent having to cut the mouse cable up, I made this adaptor. If you still can't follow it, please let me know and I'll try to redescribe it. This does work for me. I've been using it for 6 or so months now [Note, it's been 2 years now!] with no problems at all. It does take some soldering skills, so if you're not so hot at soldering, find a friend to help.

As far as I know, this does not effect your Atari's warranty. However, I have not asked Atari.

Atari ST		Microsoft Mouse ST		expected signal
1	5	XB		
2	3	XA		
3	8	YA		
4	9	YB		
5	N/C	N/C		
6	2	Left button		
7	N/C	+5VDC (N/C)		
8*	6	and also tie to pin 1	Ground	

9 7 Right button

* = I am not sure why I have pins 6 & 1 tied together, but it does work.

The Microsoft mouse connector looks like this. This is the solder side,
with the leads pointing up.

```
---------------
| 1 |
| 2 3 4 5 |
| 6 7 8 9 10 |
| |
---------------
```

If you can not use the connector, the pins are numbered as follows. This
is the connector side from the Microsoft Mouse plug:

```
/------------\ This is a view at the front of the connector.
/ Blank "KEY" \ It is where the plug from the mouse would be.
/----------------\ The pin labeled 'n' is not connected.
| n 4 X 8 | The place labeled 'X' is filled, and does not
| 9 7 1 2 | have a pin.
| 5 6 |
\ /
\------------/
```

Have fun!

For those who don't want to face wiring up a Microsoft mouse to their
Atari, there is another solution. I just bought a Golden Image Mouse
and I'm very pleased with it. They have an Atari ST version, so you
just plug it in. The feel is similar to a Microsoft mouse, but the
mouse is slightly larger.

It's made my working time with the computer much less stressful. I
highly recommend it to anyone who works with their Atari a lot.

I'm not affiliated with this company in any way, I just like this
mouse.

It cost me $70 Canadian, and was worth every penny. As a comparison,
the standard Atari mouse costs $45 here.

your note prompted me to re-attempt getting my 3 button logitech to work.
it's very slightly different from the microsoft. The two up/down wires
must be swapped--they are backwards from the microsoft configuration.
I connected the right and middle buttons--the middle and left buttons
work as right and left. Logitech's "technical information" is too
sketchy for me to do more than guess what's going on (a page and a half
on hardware and many more pages about software stuff that's of no use
to an st user.)

Hi

I'am using a FREEWARE Mouse Driver for all serial ports on any Atari.
It's called MOUSE v.2.3.

Works on Modem1, Modem2, Serial1 or Serial2 under any TOS/MTOS/MagiC 2/3.

Works great with Microsoft Mice, Mouse Systems Mice and Logitech.
3rd Mousebutton has double click feature.

BTW:
The german Computer Magazine ST-COMPUTER had a hardware project that
makes it possible to use Microsoft-Mice work on the standard Mouse port
of the Atari ST(E), MegaST(E), TT and Falcon.

Its a lot of hardware (Processor, Eprom) and stuff, cost: about 60$

Sorry for my bad english, School is a long time ago ;-)

Greetings from (the rainy) Germany

>Bis denne, Jochen ::-)

I have commented this mail in all german speaking newsgroups. This would not have been posted, if Jochen read the manual carefully an knew how to use his frontend/BBS. It is true that I received a registration from him, but since 'Before Dawn' is *shareware* and I never promised to reply on every registration (i.e. not on every registration for versions before 1.30), there is nothing to complain about.

If anyone registered for 'Before Dawn' and has not received a disc, manual or whatever I promised in the manual/an EMail or else, he should contact me by writing a *letter*! This has happened with two letters I've sent to Sweden, so it is quite possible that it happened to your's, too.

Please note: the EMail address in the manual is no longer valid!!

Ciao,
Arne

Date: 1995-05-29 00:00:00 UTC
From: mdekker@fwi.uva.nl
Message-ID: <3qcdu2$pbr@turing.fwi.uva.nl>
Source record: 164714

Hi, I am working in paris for a couple of months, are there any atari dealers in paris? Last year fnac was still selling atari games, but they no longer seem to do this. Any other places where I can buy some atari hardware? looking for a cheap portfolio.

thanks.

That article was posted using a piece of software which FORGES approves
by the moderator. All the other moderated groups got this message, as
well as the unmoderated ones. Several cancels were sent after it
(as well as another spam "Are you named in somebody's will").

The moderator had nothing to do with the article appearing.

If you want adresses of atari dealers in Paris you can buy the french
magazines ST-Magazine and Start Micro.

You can also read the french news group fr.comp.sys.atari

>which is harder - it lobs green balls at you.

AFAIK the machine gun is on the second level: Turn right as you come out of
the elevator, enter the dining room and kill the three spiders you find
there. You will find the machine gun there - pretty nifty, but I found
no ammo for it :-(Also, getting out of the room is a bit tricky. Pay attention
to how the doors sometimes open by themselves. Use that knowledge.

BTW, where didi you find the yellow key? I only found the red sitting by the
bomb on level 3.

I agree. I bought a second (spare) copy of the Sentry, unopened, for $1.00
and got Shufflepuck Cafe a few years back for about $6.00. These are great
games, and if you can't find them anywhere else they might be worth the
price (both listed for well over that amount when they were released back
in the 80's).

Hello everybody...

I'm working on a Falcon030 with a VT100 Emulator to access my internet provider. I need Chimera badly, but...

Is it capable of connecting to EVERY provider with a dynamic SLIP connection?

Why is it so cheap? ($25) Is it very limited compared to Apple/PC packages?

If anybody has tried Chimera, would he/she be so kind to post the experiences with this program? This would be greatly appreciated!

Thanks for reading this...

Martin Molenaar, mss@xs4all.nl

Anybody ever seen an Atari 1450XLD? That was a RARE computer
indeed. It did have an internal 5.25" drive, internal 300bps modem and
internal speech synthesizer though. Circa 1983 I think.

Look for a shareware/freeware program called SETSEEK, it will do exactly what you want and has no noxious side effects (grin). I use it to change the seek rate of my B drive when I switch from my 3.5" to my 5.25" drive mechanism. I seem to recall that it was Codehead freeware, but don't hold me to that. Good luck!

re: Falcon Speed
I've been running it now for over a year, and am quite happy with it. Considering that it is running at 286/16 speed, it does a good job. MOST Windows programs seem to run alright with it, but if there is an attempt to access high level colors (ala 256), there are problems. Some games even will run on it, given that they are not 256 color games. I don't know what you are planning on doing with the Falcon Speed, so I can't really say it would be worth your while. However for me it has been of benefit since I was able to have an IBM compatible machine available to run quite a few business-oriented programs.

YMMV

Whilst not wishing to disagree with this attitude in any way - it's
spot on in my opinion - I think the point here is that at least you
can network together Doom on a PC.

The fact that you can run industry standard software and games is
reason enough for most people to buy a PC. The fact that a Falcon has
a nice OS and some good software is enough to use that.

In a perfect world we'd all have one of each.

In article <3pfgiv$20l@newshost.uni-koblenz.de>
oberle@informatik.uni-koblenz.de (Christoph Oberle) said:-

>OK, but what does CS-TeX create as output? Does it create
>a standard DVI file that can be printed out on any other
>platform that has TeX installed?

Yes, it does create a 'standard' .dvi file. I've mixed .dvi files from
CS-TEX on Atari, with LaTeX on a Sparc 10 & Linux/i386.

>I wonder if you could create a document with LindnerTeX, including
>IMG files and 100% the same result under UNIX on a SUN workstation.

But IMG files are Atari specific. You can include .eps files & scake
them to any size you want - under any LaTeX.

>Agreed, but can you expect that CS-TeX is supported any further?

Possibly not :-(

>But not _directly_! Every font that you need in a certain point size
>has to be created with METAFONT first and saved as a compressed bitmap.
>If you do this for _every_ point size that you might ever need, your
>machine will be blocked for hours with this task. And afterwards, you
>might have very few disk space left on your TeX partition.

The compressed files you mention are only required when printing the
dvi file, and you can create fonts *as you need them*.

>Now don't tell me that this is an easy and flexible way to handle fonts.

Well, it is, sort of. When I have missing fonts they're created
automatically & put in the right place.

>I do not have any doubts that LaTeX is a very powerful system,
>especially to create long documents with mathematical equations,
>lots of references etc. However, I don't think that it is really
>easy to use, especially for beginners, and that one doesn't have
>to care at all about how the output is going to be.

But the whole point in writing *any* document in any system is that you
should care about how the output is going to be. Otherwise, the
documents produce may be badly layed out & possibly confusing.

>For example, LaTeX doesn't free you from the task to set pagebreaks
>right.

I've found that LaTeX puts page breaks in all the right places, most of
the time. Where it dosn't put pagebreaks in the right place use \newpage.

>It also doesn't tell you for a given tabbing environment
>whether a word, placed at a certain tab position, will exceed to
>the next tab position or still fit in its column. The problem is
>similar when you want to place text in a given table environment
>with relatively narrow columns (linebreaks ...).

Mmmm.... Are you confusing \begin{tabbing} with \begin{tabular}? As for
narrow columns, you can set the column width with p{1.25in} in the
tabular environment.

>LaTeX doesn't do everything automatically. Neither does any other
>typesetting or wordprocessing software do this. But as soon as
>problems like the above arise, a wordprocessor like papyrus is
>quicker and easier to use.

Depends on what you're doing, I suppose.

>LaTeX is clearly weaker than papyrus when it comes to _other_
>features that are more DTP-like, e.g. creating a "newspaper
>style" page layout with text going from one box (not only
>columns) to another and around graphics.

That's a bit subjective. LaTeX has a two column mode, and it is possible
to add on a multicolumn mode (.sty file), and I can see no reason why
LaTeX can't be made to do what you say.

>I don't claim that papyrus is the best software to create
>documents, nor do I want to say that LaTeX is the worst
>system to do this. Every system has its specific advantages.
>However, LaTeX's advantages only become relevant with large
>documents that contain equations, use a lot of references
>etc.

True :-)

BB> got an invalid boot sector.
BB>
BB> I don't want to save the info that's on the drive, just reclaim the
BB> lost space so I can download more stuff! Any help would most
BB> definately be appreciated!

I had similar problems with a partition a few months ago. Knife didn't accept the boot sector, etc. The only thing that worked was, believe it or not, FastCopy Pro. It happily looked into the boot sector and allowed me to rebuild it manually. Only the first line was really essential and that was enough fro me to get into the drive and copy FAT 2 over FAT 1 and correct the problem. You can simply look at another partition of the _same_ size to get the necessary information. The only exception is the randomised ID number used for each partition. You'll have to make one up yourself.

ATB,
Tom

Hi, Does anyone know if Gasteiner in Germany have an e-mail address ?

I am trying to get one of their Toplink host adaptors to work with an
IBM SCSI drive but I'm having little success.

I have tried gasteiner in the UK, but the reason I got from them as to why
it wouldn't work with my IBM drive was "Erm...I don't know". They
suggested that the power supply was not big enough, so I asked them
how much current did the Toplink take. The answer: " Ohh, about five
VOLTS " !!!!

You see what I'm up against ?

That is why I want to talk to someone in Germany :-)

Thanks in advance,

Kev.

Any external modem should work fine. Exept it aint fast enough for 28.8
though...

> What software is best (preferably shareware)?

My best pick for getting full 16 color ANSI graphics is ANSITerm, if color
ANSI isn't important to you try Teddy Term.

> Where/How does one get an internet/email account in the UK?

Well, on my modem the command is "AT&C1", hopefully that will work.

> Yes. Format the disc on the ST first.

With the older TOS versions this won't work, you need a special formatter
to format PC compatable disks on old TOS versions, since you have no way
of getting such a program just type "FORMAT A: /F:720" from DOS on the PC
with a blank disk in drive A:. (change it to drive B: if needed)

Ah well... If you ever do make it to an MS-DOS machine, shove a disk in
the drive, and type "FORMAT A: /S", this will format an MS-DOS boot disk
in drive A:, you might have to change it to B...

Actually, I dunno the exact details, but MS-DOS ver 3.2 and older is*
public domain, but 3.2 doesn't support double-sided 3.5" disks, only
single sided, if you want I'll get you an MS-DOS 3.2 boot disk with
utilities...

MiNT, MiNTnet, tcsh, etc... IIRC should work fine on any machine with the
proper memory & hard drive space, its just Xwindows and Chimera that need
a TT/Falcon/Medusa to work well, if at all...

I tried viewing a GIF that was about 200x600 in size, it streched the X to
320 with black vertical bands of pixels about every 10 pixels, and squashed
the Y down to 200, it didn't give me that "View screenfull, squash pic"
dialog eather, I forget if it was with ver 3 or 4, this is on a 520ST.

At 14.4 you will need a patch program called HSMODEM.

> 2 Where can I get some terminal software and fast.
> 3. Can I use my IBM PC to download stuff, in other words are the
> disk formats in anyway compatable? That way I could use my Pc to
> download terminal software.

Yes, the Atari will happily read PC 720k disks without any help. Type
"FORMAT A: /F:720" to format a 720k disk in drive A on the PC.

> 4 Are there any good boards where I can get some games and stuff
> like that.

If you have full internet you can FTP stuff from atari.archive.umich.edu,
that place is very* busy, you probably won't get a connect, try one of its
mirrors at mirror.archive.umich.edu. You can also try hensa.micro.uk, it
think thats the correct address...

> 5 Is there a WEB browser, or anything that works with TIA

There really isn't a good way of cruseing the WWW on the Atari, there's
Lynx which is a text browser that I think will work, and there's a
graphical browser called Chimera, but I dunno if it will work on a ST, I
think you need a higher powered model for that. Your best bet is to just
use your PC.

> 6 I also once heard your could download and play Sega Genisis games
> On an ST, is this bullshit?

I think it is, might be a rumor stemming from a popular Genesis game
called Golden Axe being converted to the ST. I saw this game in a PD
library catalog, I'd like to get it but I'd rather get it with my *free*
FTP access than spend money getting it from the PD library.

That's impossible (at least w/o IKBD code modifications) because the
mouse/joystick button recognition is too slow for receiving asynchronous
serial data.

There are some MS-mouse drivers available, but the Microsoft mouse
always has to be connected to an RS232 port.

At least James Woods doesn't hang out here... But I think you mean the
serial port. If you want to hook up a serial mouse to the mouse port you
would need to do some major surgery.

Just read the binary contents of the Atari's memory location 0xFC0000 to
0xFEFFFF (192 KB) into a datafile and name it TOS.IMG. There are some
tools around that will do it for you, e.g. with the TurboAss package. I
don't know whether there are any changes necessary for the Atari TOS to
work on an emulator for the Amiga...

>the programs use it. Period. The same is certainly NOT true for TeX
>(who's font handling gives me the shakes).

You're absolutely right. But when TeX was being designed, there _was_ no font handling standard. The author of TeX just _had_ to invent his own, and that one just didn't become the standard. And that's understandable, as today's computers _are_ fast enough to raster vector fonts on the fly. Knuth's (the author of TeX) way of implementing vector fonts were not too bad, taking into account the lack of graphical systems those days. The idea to have vector fonts in some kind of programming language (MetaFont) was---in those days--- the only way to do it. If TeX would have to raster these fonts on the fly, it would have become _awfully_ slow. One big advantage of this way of working is that I can TeX perfectly fine on an 8086 system.

> This means that when it's time to move from the 3 page colour

>what the simple programs have done for the world.

You put words into my mouth. Please, of course I'm not against
freedom of speech. Come on. As a matter of fact, the TeX community
is comparable to GNU when it comes to this sort of things. Anything
that has to do with TeX and is _not_ completely free (a small
minority) is heavily frowned upon by the TeX community. With TeX,
people can produce documents without knowing the fine parts about
printing and typography as well, but the difference is that these
documents come out typographically correct anyway.

Again, TeX is free, and FrameMaker (to name an example) certainly is
not.

>> _If_ you already know what makes a document readable and
>> typographically correct. Most people don't.

>Yes, but learning THIS is MUCH easier than learning a language. I can

I don't think so. Typography is an art. You can't learn that in an
hour.

>go out and buy huge numbers of books with design tips and such that tell
>me in an hour about this stuff. The Mac is Not a Typerwriter is a perfect
>example, you can flip though that in an hour and understand it all. Try
>the same with a TeX manual?

Granted. There's much more literature about other systems, but I must
remark that most of that stops at producing a table. In most of the
manuals for wordprocessors, there was *nothing* about typography in
the book.

Regards,

True Paint really isn't a good program. It could be, but it isn't =-(...
It's slow, incompatible in too many ways, and doesn't offer much anything
special.

True Image is much better, IMHO. It uses DSP for a couple of effects
(e.g. sharpening) on Falcon, and generally it works pretty well. It has
(at least a version I used at work a year ago) some problems with its
reliability, and the color-selector didn't work correctly at all. Using
virtual memory (Outside 3) it also was very slow when you used some of
its painting functions. But the filters work fine, and the program knows
some nice effects - so I guess it's worth its price! Especially, if any
updates have been made lately.

Errr, that's just a comms program, ok for a shell account.

If you want something proper then you'll want a PPP/SLIP login through
someone like Demon.

For this you can use ka9q and OASIS with it.

There is a common problem with moderated newsgroups. That problem has to
do with "forged approvals". It is currently being discussed in the
mailing list re: moderated newsgroups (for moderators).

The bottom line is, that the usenet is not entirely safe, and it is possible
to approve a post without going through the original moderator (for
comp.sys.atari.annoucne that would be me) by forging the approval.

It is rather poor and uncooperative but there is nothing I can currently do
to prevent it actually from happening.

Cheers

In what way do they differ? As I understand both machines use the same WD1772 floppy controller and there's nothing about the way disk drives work to distinguish between them - at least I thought they were all the same.

Admittedly, that would avoid the problem, but its rather an expensive solution, isn't it? Without Twist (the price wasn't listed in the add. I checked), this costs over 3 times what Works costs, and I already have that!

Source record: 164624

> Like you, I ignore everything but the text. I just type, add in my
> formulas, ask it for a TOC and out it goes. What version were you

Which is probably an important part of the discusion. As a mathematician, I couldn't "add in my formulas", there are too many formulas and symbols all through the text, and it would be impossible to do anything other than put them in as they occur.

I used to use Signum (which was a major reason for being an Atari), which is WYSIWYG and very suited for mathematics (wrote a whole camera-ready book using Signum).

I finally changed because of pressure from journals. That's the other advantage of TeX (LaTeX, etc.), that files are easily portable from one machine to another. Very useful is if there is more than one author, and nowadays most mathematical journals (and some publishers) ask for documents in TeX format. If my documents were to be conventionally typeset, or else camera-ready, I would probably still stick to Signum.

Here they are: 1. Do You need TeX to work with LaTeX ? (Or what do one need?)
2. Are there any font editors for it ? We've got 18 native
characters here in Poland... :(

Why does everyone say ``no one would use [La]TeX to write a one-page
letter? I do it all the time -- in fact the only letters I don't use
TeX for are the ones I write by hand.

BTW anyone want to buy a copy of That's Write? I never seem to use it.

Check out Writeboot504. It isn't an Autofolder program. What it does is
write a small routine in the boot sector of your boot disk that will
change the seek rate of your A and B drives. Works even if you boot from
the Hard drive! Also does other neat stuff. It's on atari.archive.umich.edu
as wrtbt504 only I forget if it was arc, lzh or zip. Hope this helps!

For Sale:

Atari Mega STe computer $375
16MHz Motorola 68000
4MB RAM
1.44 3.5" Floppy Drive (internal)
45MB Hard Drive (internal)
TOS 2.05 on ROM
External Keyboard
Standard Atari 2-button Mouse
Power cables, etc.

Atari SC1224 Color Monitor $100
Atari SM124 High-rez Monochrome Monitor $ 50

Software:
Papyrus Gold 3.57 (US/UK) $150
AtariWorks $ 50
STalker 3.02 $ 20
NeoDesk 4.0 $ 25

Known Problems:

The Machine will not recognize the hard drive. I suspect that the
host adapter has gone bad ($99 part).

Prices listed are by no means firm. Best Offer for both Hardware and
Software. All Offers will be considered. Please e-mail if
interested!

NO! Format the disk on the *PC* first. The formats are essentially the same except for two bytes in the bootsector that were mistakenly swapped on the earlier ST's. ST's don't care shit about this but PC's do....

I don't know about NY City, but as an example/guide,
I live in Minneapolis, Minnesota and I pay $24.95 a month for
Dynamic SLIP, CSLIP/PPP. Unlimited hours and times. I am
very close to dropping GEine and CServe altogether.
At the moment I am not on my FALCON or STe but
I am looking into upgrading my FALCON to 14 Megs and
switching it to a UNIX clone machine. Keep at it people, the
software is getting better and better. BTW, I already have a
68882 FPU in it, the internal 85 HD and external 540 Meg.
Should be enough for LINIX or MINIX, whatever the UNIX
clone's name is.
Rich Mier LOTS of ATARI's!

Funny, I never had any problems formating them on a STe and
using them on a PC. TOS 1.06. Just don't use any High Speed or TWISTED
formats or use more than 9 sectors per track. A few times I've even been
able to get a PC to read a 807K Byte formated disk. 'Ground' away on it
for quite some time but it did manage to transfer all the data. Oh yes, the
same goes for a 1.44 Meg formated on my FALCON. The PC doesn't seem
to have any problem with it.
Are you sure this isn't just a TOS Revision problem?

Nope, Dan had his facts correct. I've run this system (i'm using it right now)
on a 1040STe with 4M of Ram and a SyQuest 44M HD. That's it! (I used Chimera
oviously under X-Windows).

I'll admit loading a page with a lot of Graphics will crash Chimera on a basic
4M system (If the graphics take more memory than what you have left this tends
to happen).

But the system is quite fast and very reliable. I used it for 4 hours
straight yesterday. (Specially using the PPP link).

While I haven't worked with SLIP (static or dynamic) it is suppose to work.
(Also includes CSLIP). I'm currently connected (as I type this) using a
dynamic PPP - with Chimera, Telnet and FTP all running at once.

>Why is it so cheap? ($25) Is it very limited compared to Apple/PC packages?
>
The answer is everything is PD. TAF has just collected all required programs
(thanks Sam M.) and put them together on a set of diskettes. The $25 dollars
is for the diskettes, mailing and overhead. We can't charge for other peoples
work. (A special thanks to all of them!)

>If anybody has tried Chimera, would he/she be so kind to post the
>experiences with this program? This would be greatly appreciated!
>
What do you want to know? The only issues are:
(1) It cannot display HTML 3.0 features (.jpg's, tables, etc.)
(2) It's mono - no colour - but still looks excellent in my opinion.

The bottom line... The more memory you have the better. But I've used the
program over long periods (several hours). This system is great! If
you just want a program to give you WWW access it all there. If you want
something to grow with and build into a much larger system, this is a great
starter kit! (But I admit I'm bias)

For more information check out the TAF home page...

3721. Picture Conversions (help!!)

Newsgroup: comp.sys.atari.st
Date: 1995-05-30 00:00:00 UTC
From: Dave Munsie <dmunsie@delphi.com>
Message-ID: <5m7dcrZ.dmunsie@delphi.com>
Source record: 164646

I am looking for a good all-in-one picture conversion program that will run on a ST/STe. Here are the features I would need the most:
Load: GIF,TIFF,IFF,PCX, etc...
Save: GIF,IFF,PC1 etc...
It also needs to be able to convert the source pic to the dest pic using a locked in palette, so I could define a 16 color palette and then convert several pictures in one go using the same destination palette. Adjustable dithering would be needed also. My primary target resolutions would be 320x200x16 and 320x200x256. Please point me in the right direction be it pd,sharware or commercial. Thank you..

I also used Signum for my reports i almost 3 years, but after i started on the university people were suddenly "talking" LaTEX, so i had to switch to LaTEX.
A shame really, because Signum was a BRILLIANT program, especially if you count in when when version 2.0 was made (1987!). At that time there was ABSOLUTELY NO program on any other platform (PC, Amiga, Mac etc.), that had such wonderful graphic and scientific features in WYSIWYG.
When i still was in highschool i convinced two of my friends, who both owned an Amiga at that time, to bye an Atari 1040STE. It was the only (inexspensive) way to get i serious computer for writing reports and be able to play decent games. The PC was pure crap at that time and the Amiga was a games machine with a few very basic wordprocessors.

Yeah well - times certainly change. Ohh man it's only 4 years ago !

Keep Cool and Flying...

VT> where I can get some games and stuff like that.

If you buy your modem you should have no problems. Most any BBS that carries Atari software will have terminals programs on it. I use Teddy Term and ANSIterm and they work wonderfully. You can use the PC to d/l files and transfer it to the Atari. I have done that. What TOS do you have? If it is 1.4 than all you have to do is to format a disk in your ST and insert it into the PC. If you have 1.0 then you have to find a formatting program for the ST that will format a disk so the PC can read it. Redform is a program that will do that. There are tons of BBS's that you can get Atari stuff. I can get you some number if you wish.

3725. Imagesetter vs 1200DPI Laser

Newsgroup: comp.sys.atari.st

RMcD> ....You suggest in the below article and interplay that you
RMcD> might want to stay with what you have and get an imagesetter.
RMcD> You might also look at the 1200 dpi plain paper laser printers
RMcD> currently serving the commercial graphics market. They have a
RMcD> format of 12x19" to allow for a bleed 11x17 image to be produced.
RMcD> Pretty neat, and priced below $7,000 which is by far cheaper than
RMcD> a new imagesetter would cost you. If you need to know more, drop
RMcD> me email and I will look up the company name and stuff and pass
RMcD> it along to you.

Regards, Rod MacDonald [stinformer@chatlink.com]

What I previously wrote was more in the nature of thinking out loud.
Using the Windows NT version is really a moot point as several of
the local lino bureaus offer modem service. This of course opens up
the possibility of saving SL documents as a Tiff file and modeming it
to a say a Quadra. As we both know, 2500dpi ++ full colour layouts are
not everyday fare, and the 1200 dpi lasers could well be viable. The
only one I have looked at is the Lexmark, but I understand Qume makes
one as well. My main concern is the availability of drivers for SL.
I have heard that an imagesetter like the Ultrasetter is around
$40,000 Cdn. Last choice, by far! :-) I would indeed like to know
more and would appreciate getting the company name, etc. Again-is
there an SL driver for it? Thanks for the reply and the help!
Although we are just in the process of starting the business, I am
very excited at the prospect of using Falcons and TT's to set up my
own business.

Does anyone know if there is a forms compatible browser for the ST
maybe using SLIP or PPP???
I noticed that netscape is available for linux but linux wont run on a plain
ST.
I love netscape on my SPARC at work and would like to have the capability at
home on my ST. Tried Genie using Lynx and its nothing like netscape.
Thanks,
Bob

I haven't tried SLIP myself either but many people on the net have. I prefer
PPP myself because there's less setting up involved. I think most
services which offer SLIP tend to offer PPP as well.

The Atari community tends to depend very much on the users for support.
I think one good result of this is that most Atari users have really
learned a lot about computer basics and advanced topics as opposed
to Mac and PC users. No one will hold your hand with this platform!
If you go ahead and try all this X-win stuff you will learn a lot of
stuff about Unix based systems and this is not a bad thing!

The docs for the different parts of the distribution are on the TAF disks
and contain many names and addresses of people who have really
contributed to keeeping this platform alive. I woiuld encourage
users to send a postcard or e-mail and tell them you appreciate it - I
know I do!

As for an Atari based browser I still plan to write a stand alone one but
I have yet to finish my thesis (real soon now) and my consulting business
is getting busier ans busier. Hopefully by the fall I'll have something
ready for testing.

I have 12M of RAM and have rarely run into problems. I find the X-win setup
more stable than GEM/TOS incidentally.

Steve'r right about a starter kit - FTP and TELNET are included. In Fact,
most common atari ftp sites are even included on a menu so you can ftp
more stuuf for your system to grow with very little effort.

Sam

I thought Chimera itself is free, and its just the nifty MiNT installer
that costs $25?

It could be quite possable that the PC/Mac terminal is sending init
strings without telling you, have you tried adding an "&C1" to your init
string? If AA is disabled then its up to Connect to sense the "RING" reply
or the rarely used ring detect line from the modem, and give the modem an
"ATA" command, is your modem set up to send a "RING" reply string? I'll
hve to look up the command for that one...

At a recent computer show I got the chance to play around with an XE game system, Ballblazer was pretty impressive, but I never go the hang of the controls... I also tried Rescue on Fractulus, it was fun, and pretty impressive too, unfortunatly I don't think ST versions were ever made of these games. Sorry! :(

As far as i know Qbbs has been updated and should now work on the Falcon.
But i fear you have to call out side your country for this BBS.
